# **■**How to read the model name

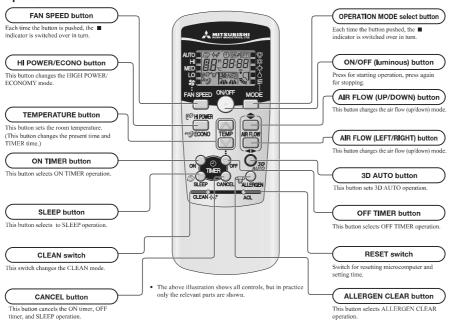

# 1 OUTLINE OF OPERATION CONTROL BY MICROCOMPUTER

- 1.1 SRK, SRF and SRR series
- (1) Operation control function by remote control

### Remote controller

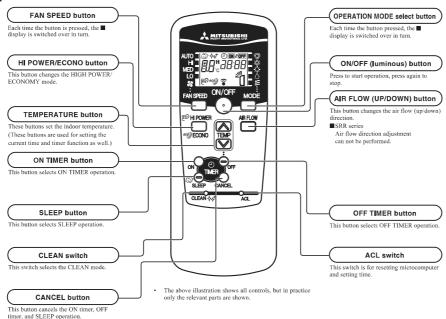

### **SRK** series

**♦** Operation section

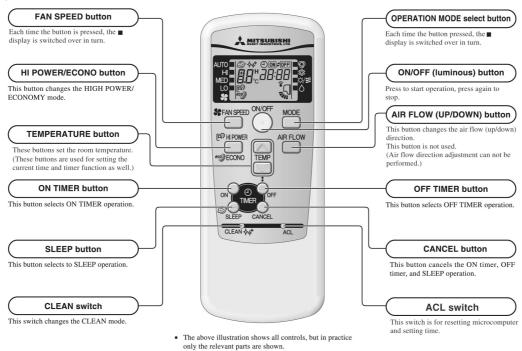

# **SRF** series

### **♦** Operation section

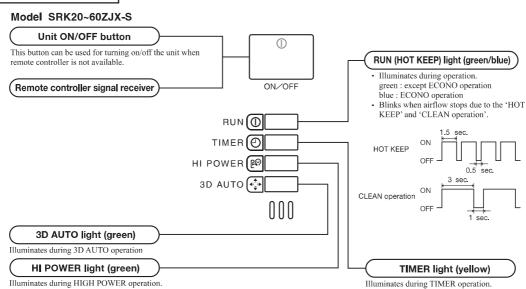

# **SRR** series

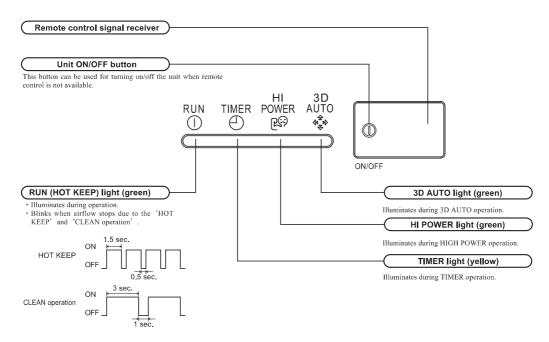

### **♦** Operation section

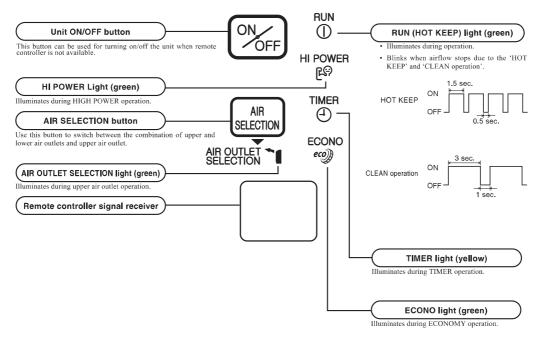

# Unit indication section

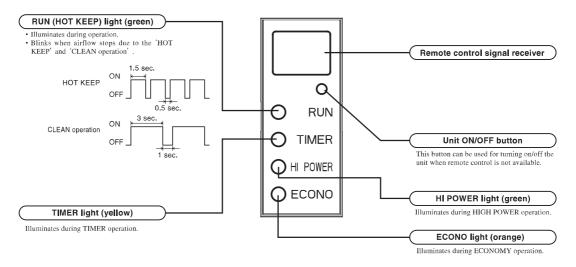

### Model SRK20~50ZJ-S

### Model SRF25~50ZJX-S

### Model SRR25~60ZJ-S

# (2) Unit ON/OFF button

When the remote controller batteries become weak, or if the remote controller is lost or malfunctioning, this button may be used to turn the unit on and off.

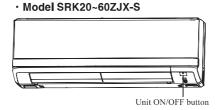

### (a) Operation

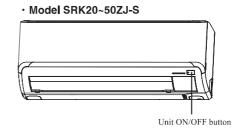

Push the button once to place the unit in the automatic mode. Push it once more to turn the unit off.

### (b) Details of operation

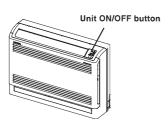

The unit will go into the automatic mode in which it automatically determines, from indoor temperature (as detected by sensor), whether to go into the cooling, thermal dry or heating modes.

| Function operation mode | indoor temperature |                | Flap/Louver | Timer Switch |  |
|-------------------------|--------------------|----------------|-------------|--------------|--|
| Cooling                 | About 24°C         | 25°C Auto Auto |             |              |  |
| Thermal dry             | About 25°C         |                |             | Continuous   |  |
| Heating                 | About 26°C         |                |             |              |  |

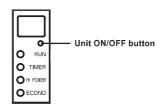

# · Model SRF25~50ZJX-S

# · Model SRR25~60ZJ-S

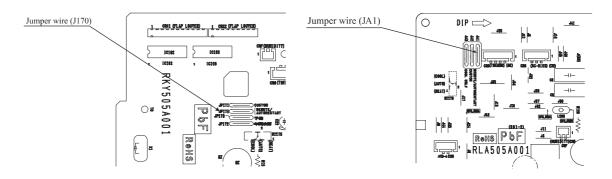

# (3) Auto restart function

- (a) Auto restart function records the operational status of the air-conditioner immediately prior to be switched off by a power cut, and then automatically resumes operations after the power has been restored.
- **(b)** The following settings will be cancelled:
  - 1) Timer settings
  - 2) HIGH POWER operations

Notes (1) Auto restart function is set at on when the air-conditioner is shipped from the factory. Consult with your dealer if this function needs to be switched off.

- (2) When power failure ocurrs, the timer setting is cancelled. Once power is resumed, reset the timer.
- (3) If the jumper wire (J170 or JA1) "AUTO RESTART" is cut, auto restart is disabled. (See the diagram at right)

 ModelSRK20~60ZJX-S SRF25~50ZJX-S SRR25~60ZJ-S • Model SRK20~50ZJ-S

# (4) Custom cord switching procedure

If two wireless remote controller are installed in one room, in order to prevent wrong operation due to mixed signals, please modify the printed circuit board in the indoor unit's controlbox and the remote controller using the following procedure.

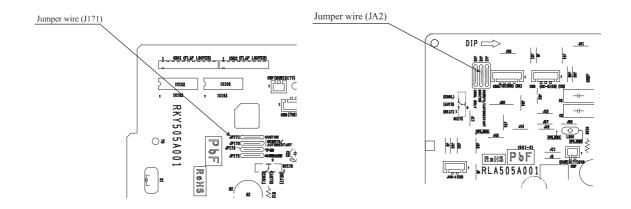

Be sure to modify both boards. If only one board is modified, receiving (and operation) cannot be done.

### (a) Modifying the indoor printed circuit board

Take out the printed circuit board from the control box and cut off jumper wire (J171 or JA2) using wire cutters.

After cutting of the jumper wire, take measures to prevent contact with the other the lead wires, etc.

 ModelSRK20~60ZJX-S SRF25~50ZJX-S SRR25~60ZJ-S • Model SRK20~50ZJ-S

### (b) Modifying the wireless remote controller

- 1) Remove the battery.
- 2) Cut the jumper wire shown in the figure at right.

# (5) Flap and louver control (SRK and SRF series only)

### ♦ SRK series

Control the flap and louver by AIRFLOW ♦ (UP/DOWN) and ♦ (LEFT/RIGHT) button on the wireless remote controller.

### (a) Flap

Each time when you press the AIRFLOW **\$\DDOWN**\) button the mode changes as follows.

• Angle of Flap from Horizontal

### Mode SRK20~60ZJX-S

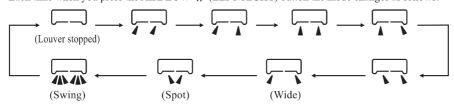

| Remote controller display | -9          | P.          | Ŋ           | Ş           | Ş           |
|---------------------------|-------------|-------------|-------------|-------------|-------------|
| COOL , DRY, FAN           | Approx. 5°  | Approx. 20° | Approx. 35° | Approx. 45° | Approx. 60° |
| HEAT                      | Approx. 20° | Approx. 35° | Approx. 45° | Approx. 60° | Approx. 75° |

# Model SRK20~50ZJ-S

| Remote controller display | -9          | ,J          | Ŋ           | Ş           | Ş           |
|---------------------------|-------------|-------------|-------------|-------------|-------------|
| COOL , DRY, FAN           | Approx. 10° | Approx. 25° | Approx. 40° | Approx. 50° | Approx. 60° |
| HEAT                      | Approx. 25° | Approx. 40° | Approx. 50° | Approx. 60° | Approx. 70° |

### (b) Louver

Each time when you press the AIRFLOW **(**LEFT/RIGHT) button the mode changes as follows.

• Angle of Louver

| Remote controller display | 4-4              |                  |                   |                   |                   |
|---------------------------|------------------|------------------|-------------------|-------------------|-------------------|
| Center installation       | Left Approx. 50° | Left Approx. 20° | Center            | Right Approx. 20° | Right Approx. 50° |
| Right end installation    | Left Approx. 50° | Left Approx. 45° | Left Approx. 30°  | Center            | Right Approx. 20° |
| Left end installation     | Left Approx. 20° | Center           | Right Approx. 30° | Right Approx. 45° | Right Approx. 50° |

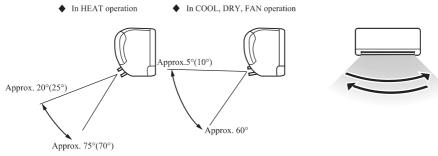

### (c) Swing

### 1) Swing flap

Flap moves in upward and downward directions continuously.

### 2) Swing louver

Louver moves in left and right directions continuously.

Note (1) value in (  $\,$  ) are for the model SRK20~50ZJ-S.

### (d) Memory flap (Flap or Louver stopped)

When you press the AIRFLOW (UP/DOWN or LEFT/RIGHT) button once while the flap or louver is operating, it stops swinging at the position. Since this angle is memorized in the microcomputer, the flap or louver will automatically be set at this angle when the next operation is started.

### (e) When not operating

The flap returns to the position of air flow directly below, when operation has stopped.

### ♦ SRF series

Control the flap by AIRFLOW **\( \Phi\)** (UP/DOWN) button on the wireless remote controller.

### (a) Flap

Each time when you press the AIRFLOW **(UP/DOWN)** button the mode changes as follows.

• Angle of Flap from Horizontal

| Remote controller display | ď           | ď           | ا ا           | <u>"</u>      | 1           |
|---------------------------|-------------|-------------|---------------|---------------|-------------|
| COOL, DRY, FAN            | Approx. 60° | Approx. 50° | Approx. 38°   | Approx. 21.5° | Approx. 12° |
| HEAT                      | Approx. 44° | Approx. 32° | Approx. 21.5° | Approx. 12°   | Approx. 5°  |

# (b) Swing

### 1) Swing flap

Flap moves in upward and downward directions continuously.

### (c) Memory flap (Flap stopped)

When you press the AIRFLOW button once while the flap is operating, it stops swinging at the position. Since this angle is memorized in the microcomputer, the flap will automatically be set at this angle when the next operation is started.

### (d) When not operating

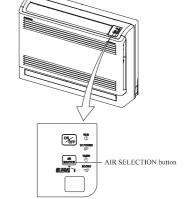

The flap returns to the position of air flow directly below, when operation has stopped.

# (6) Air outlet selection (SRF series only)

(a) AIR SELECTION button can switch between the combination of upper and lower air outlets and upper air outlet. Not operable while the air conditioner is OFF.

- Each time the AIR SELECTION button is pressed. The combination of the upper and lower air outlets and the upper air outlet can be switched.
- 2) When the upper air outlet is selected, AIR OUTLET SELECTION light on the unit display area will light green.

| ── Upper and lower air outlets ── | ——— Upper air outlet ——         |
|-----------------------------------|---------------------------------|
| AIR OUTLET SELECTION light : OFF  | AIR OUTLET SELECTION light : ON |

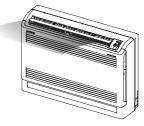

### (b) Auto air outlet selection

### 1) COOL, DRY operation

- a) In case both lower and upper outlets operation is selected in Cooling or Dry operation, both outlets will be kept for sixty minutes after the start or until indoor temperature is below the setting point. And then the air outlet will change to the upper outlet. That state will be maintained until switch is turned off.
- In case both outlets operation with Auto fan speed mode is selected, the upper outlet will be kept for ten minutes after the start or until indoor temperature is close to reaching the setting point. And then the air outlet will change to both outlets in order to spread comfort air to every corner.

### 2) HEAT operation

- a) In case both lower and upper outlets operation with Auto fan speed mode is selected, the lower outlet will be kept for twenty minutes after the start or until indoor temperature is close to reaching the setting point. And then the air outlet will change to both outlets. That state will be maintained until the switch is turned off.
- Automatic adjustment of lower air outlet direction prevents stirring up of warm air and keeps optimum comfort at floor level.

# (7) 3D auto operation (SRK series only)

Control the flap and louver by 3D AUTO button on the wireless remote controller.

Air flow selection and air flow direction are automatically controlled, allowing the entire indoor to efficiently conditioned.

- (a) During Cooling and Heating (Including auto cooling and heating)
  - 1) Air flow selection is determined according to indoor temperature and setting temperature.

| Operation mode  | Air flow selection                |                                    |     |     |    |  |  |
|-----------------|-----------------------------------|------------------------------------|-----|-----|----|--|--|
| Operation inode | AUTO                              |                                    |     | MED | LO |  |  |
| At cooling      | Indoor temp. – Setting temp. >5°C | Indoor temp. – Setting temp. ≦ 5°C |     | MED | LO |  |  |
| At cooling      | HIGH POWER                        | AUTO                               | н   |     |    |  |  |
| At heating      | Setting temp. – Indoor temp. >5°C | Setting temp. – Indoor temp. ≦ 5°C | п п | MED | LO |  |  |
| At ileating     | HIGH POWER                        | AUTO                               |     |     |    |  |  |

- 2) Air flow direction is controlled according to the indoor temperature and setting temperature.
  - a) When 3D auto operation starts

|        | Cooling                     | Heating |  |  |  |
|--------|-----------------------------|---------|--|--|--|
| Flap   | Up/down Swing               |         |  |  |  |
| Louver | Wide (fixed) Center (fixed) |         |  |  |  |

b) When Indoor temp. – Setting temp. is ≤ 5°C during cooling and when Setting temp. – Indoor temp. is ≤ 5°C during heating, the system switches to the following air flow direction control. After the louver swings left and right symmetrically for 3 cycles, control is switched to the control in c).

|        | Cooling Heating  |  |  |  |  |
|--------|--|--|--|--|--|
| Flap   | Horizontal blowing (Fixed) Slant forwardl blowing (Fix |  |  |  |  |
| Louver | Left/right Swing                                       |  |  |  |  |

c) After the flap swings for 5 cycles, control is switched to the control in d).

|        | Cooling        | Heating |  |  |  |
|--------|----------------|---------|--|--|--|
| Flap   | Up/down Swing  |         |  |  |  |
| Louver | Center (Fixed) |         |  |  |  |

d) For 5 minutes, the following air flow direction control is carried out.

|        | Cooling                    | Heating                        |  |  |
|--------|----------------------------|--------------------------------|--|--|
| Flap   | Horizontal blowing (Fixed) | Slant forwardl blowing (Fixed) |  |  |
| Louver | Wide (Fixed)               |                                |  |  |

e) After 5 minutes have passed, the air flow direction is determined according to the indoor temperature and setting temperature.

| Operation mode | Air flow direction contorol       |   |                                       |  |  |  |  |
|----------------|-----------------------------------|---|---------------------------------------|--|--|--|--|
| At cooling     | Indoor temp. – Setting temp. ≦2°C | $2^{\circ}$ C < Indoor temp. – Setting temp. $\leq 5^{\circ}$ C | Indoor temp. – Setting temp. > 5°C    |  |  |  |  |
| At cooling     | The control in d) continues.      | Control returns to the control in b).                           | Control returns to the control in a). |  |  |  |  |
| At heating     | Setting temp. – Indoor temp. ≦2°C | 2°C < Setting temp. – Indoor temp. ≦5°C                         | Setting temp. – Indoor temp. > 5°C    |  |  |  |  |
|                | The control in d) continues.      | Control returns to the control in b).                           | Control returns to the control in a). |  |  |  |  |

(b) During DRY Operation (including auto DRY operation)

| Air flow selection | According to DRY operation. |  |  |  |

| Flap               | Horizontal blowing (Fixed)  |  |  |  |
| Louver             | Wide (Fixed)                |  |  |  |

# (8) Timer operation

### (a) Comfortable timer setting (ON timer)

If the timer is set at ON when the operation select switch is set at the cooling or heating, or the cooling or heating in auto mode operation is selected, the comfortable timer starts and determines the starting time of next operation based on the initial value of 15 minutes and the relationship between the indoor temperature at the setting time (temperature of room temperature sensor) and the setting temperature.

### (b) Sleep timer operation

Pressing the SLEEP button causes the temperature to be controlled with respect to the set temperature.

### (c) OFF timer operation

The Off timer can be set at a specific time (in 10-minute units) within a 24-hour period.

# (9) Installation location setting (SRK series only)

When the indoor unit is installed at the end of a room, control the air flow direction so that it is not toward the side walls. If you set the remote controller installation position, keep it so that the air flow is within the range shown in the following figure.

### (a) Setting

1) If the air conditioning unit is running, press the ON/OFF button to stop.

The installation location setting cannot be made while the unit is running.

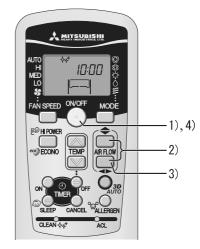

The installation location display illuminates.

### 3) Setting the air-conditioning installation location.

Press the AIR FLOW **(**LEFT/RIGHT) button and adjust to the desired location.

Each time the AIR FLOW **(**LEFT/RIGHT) button is pressed, the indicator is switched in the order of:

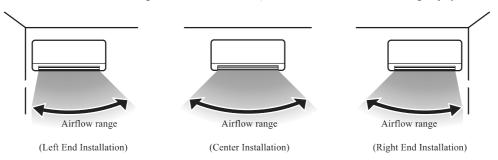

### 4) Press the ON/OFF button.

The air-conditioner's installation location is set.

Press within 60 seconds of setting the installation location (while the installation location setting display illuminates).

# (10) Determining the operating mode

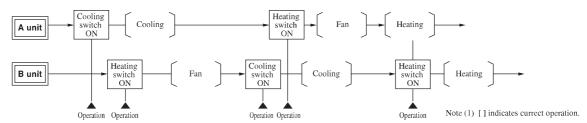

The cooling and heating operating modes are the remote controller mode that have been previously determined.

If a mode differing from these is selected after this, the selected mode will appear in the display of the remote controller, but only the fan will operate.

| Formula | First operation Second operation |  |         | l                         | Nu        |         |                     |
|---------|----------------------------------|--|---------|---------------------------|-----------|---------|---------------------|
| Example | Selected Mode                    | Selected Mode Remote Controller Display Operation Selected Mode Remote Controller Disp |         | Remote Controller Display | Operation | Notes   |                     |
| 1       | Cooling                          | Cooling  | Cooling | Heating                   | Heating   | Fan (1) | Different mode is   |
| 2       | Heating                          | Heating  | Heating | Cooling                   | Cooling   | Fan     | only fan operation. |

Note (1) If the display shows heating and the operation is fan, Hot Keep will operate.

### **Example of operating pattern**

# (11) Drain motor (DM) control (SRR series only)

(a) Drain motor (DM) is operated during the cooling or dehumidifying mode operations and simultaneously wity the compressor ON. The DM continues to operate for 5 minutes after the operation stop, anomalous stop, thermostat stop or when it was switched from the cooling and dehumidifying operations to the fan or heating operation.

| Indoor unit operation mode |  |  |  |  |  |  |  |
|----------------------------|--|--|--|--|--|--|--|
|                            | Stop (1) Cooling Dehumidifying Fan (2) Heating |  |  |  |  |  |  |
| Compressor ON              | N Control A                                    |  |  |  |  |  |  |
| Compressor OFF             | FF Control B                                   |  |  |  |  |  |  |

Inciuding the stop from the cooling, dehumiditying, fan and heating, and the anomalous stop
 Inciuding the "Fan" operation according to the mismatch of operation modes

### Control A 1)

- a) If the float switch detects any anomalous draining condition, the unit stops with the anomalous stop and the drain pump starts. After detecting the anomalous condition, the drain motor comtinues to be ON.
- b) It keeps operating while the float switch is detecting the anomalous condition.

### Control B 2)

If the float switch detects any anomalous drain condition, the drain motor is turned ON for 5 minutes, and at 10 seconds after the drain motor OFF it checks the float switch. If it is normal, the unit is stopped under the normal mode or, if there is any anomalous condition, displayed by the flashing of display lights and the drain motor is turned ON. (The ON condition is maintained during the drain detection.)

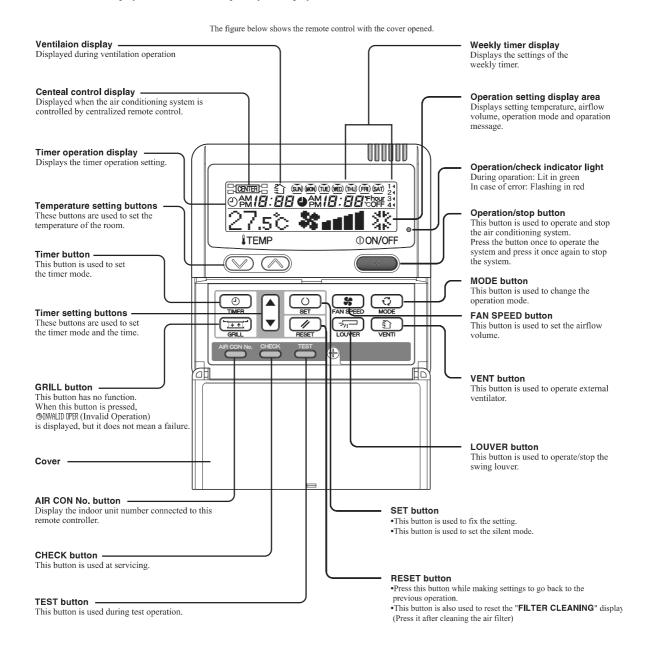

### 1.2 FDTC series

# (1) Remote controller (Option parts)

### (a) Wired remote controller

The figure below shows the remote controller with the cover opened. Note that all the items that may be displayed in the liquid crystal display area are shown in the figure for the sake of explanation

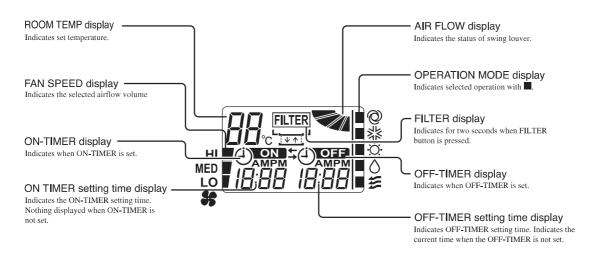

Characters displayed with dots in the liquid crystal display area are abbreviated.

 $oldsymbol{*}$  All displays are described in the liguid crystal display for explanation.

# (b) Wireless remote controller

### Indication section

### Operation section

<sup>\*</sup> All displays are described in the liquid crystal display for explanation

# (2) Operation control function by the wired remote controller

### (a) Switching sequence of the operation mode switches of remote controller

### (b) [CPU reset]

This functions when "CHECK" and "GRILL" buttons on the remote controller are pressed simultaneously. Operation is same as that of the power supply reset.

### (c) [Power failure compensation function]...Electric power supply failure

- This becomes effective if "Power failure compensation effective" is selected with the setting of remote controller function.
- Since it memorizes always the condition of remote controller, it starts operation according to the contents of memory no sooner than normal state is recovered after the power failure. Although the auto swing stop position and the timer mode are cancelled, the weekly timer setting is restored with the holiday setting for all weekdays.

After recovering from the power failure, it readjusts the clock and resets the holiday setting for each weekday so that the setting of weekly timer becomes effective.

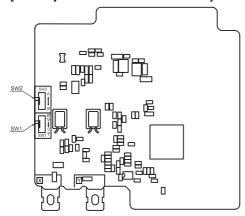

• Content memorized with the power failure compensation are as follows.

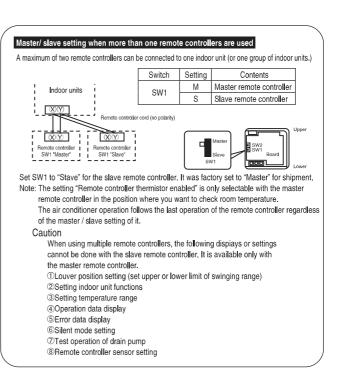

Note (1) Items®, ② and ® are memorized regardless whether the power failure compensation is effective or not while the setting of silent mode is cancelled regardless whether the power failure compensation is effective or not.

- At power failure Operating/stopped

  If it had been operating under the off timer mode, sleep timer mode, the state of stop is memorized. (Although the timer mode is cancelled at the recovery from power failure, the setting of weekly timer is changed to the holiday setting for all weekdays.)
- ② Operation mode
- 3 Airflow volume mode
- Room temperature setting
- ⑤ Louver auto swing/stop
  - However, the stop position (4-position) is cancelled so that it returns to Position (1).
- ® "Remote controller function items" which have been set with the remote controller function setting ("Indoor function items" are saved in the memory of indoor unit.)
- ① Upper limit value and lower limit value which have been set with the temperature setting control
- Sleep timer and weekly timer settings (Other timer settings are not memorized.)

# [Parts layout on remote controller PCB]

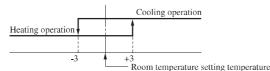

# (3) Operation control function by the indoor controller

### (a) Auto operation

If "Auto" mode is selected by the remote controller, the heating and the cooling are automatically switched according to the difference between outdoor air temperature and setting temperature and the difference between setting temperature and return air temperature. (When the switching of cooling mode ↔ heating mode takes place within 3 minutes, the compressor does not operate for 3 minutes by the control of 3-minute timer.) This will facilitate the cooling/heating switching operation in intermediate seasons and the adaptation to unmanned operation at stores, etc.

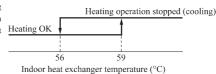

Room temperature (detected with Thi-A) [deg]

Note (1) Room temperature control during auto cooling/auto heating is performed according to the room temperature setting temperature. (DIFF: ±1 deg)

(2) If the indoor heat exchanger temperature rises to 59°C or higher during heating operation, it is switched automatically to cooling operation. In addition, for 1 hour after this switching, the heating operation is not performed, regardless of the temperature shown at right.

Heating OK

### (b) Operations of functional items during cooling/heating

| Operation                 | Operation Cooling |                   |                  | Heating          |                   |                        |                  |
|---------------------------|-------------------|-------------------|------------------|------------------|-------------------|------------------------|------------------|

| Compressor                | 0                 | ×                 | ×                | 0                | ×                 | 0                      | O/×              |
| 4-way valve               | ×                 | ×                 | ×                | 0                | 0                 | ○(×)                   | ×                |
| Outdoor unit fan          | 0                 | ×                 | ×                | 0                | ×                 | ○(×)                   | O/×              |
| Indoor unit fan           | 0                 | 0                 | 0                | O/×              | O/×               | O/×                    | O/×              |
| Louver motor              | O/×               |                   |                  | O/×              |                   | O/×                    | O/×              |
| Drain pump <sup>(3)</sup> | 0                 | X <sup>(2)</sup>  | × <sup>(2)</sup> |                  | O/×(2)            |                        | Thermostat ON: O |

Note (1)  $\bigcirc$ : Operation  $\times$ : Stop  $\bigcirc/\times$ : Turned ON/OFF by the control other than the room temperature control.

- (2) ON during the drain motor delay control.
- (3) Drain pump ON setting may be selected with the indoor unit function setting of the wired remote controller.

### (c) Dehumidifying operation

1) When the humidity sensor is not provided

Return air temperature thermistor [Thi-A (by the remote controller when the remote controller thermistor is enabled)] controls the indoor temperature environment simultaneously.

- a) Operation is started in the cooling mode. When the difference between the return air temperature and the setting temperature is 2°C or less, the indoor unit fan tap is brought down by one tap. That tap is retained for 3 minutes after changing the indoor unit fan tap.
- b) If the return air temperature exceeds the setting temperature by 3°C during defrosting operation, the indoor unit fan tap is raised. That tap is retained for 3 minutes after changing the indoor unit fan tap.
- c) If the thermostat OFF is established during the above control, the indoor unit fan tap at the thermostat ON is retained so far as the thermostat is turned OFF.
- d) After stopping the cooling operation, the indoor unit continues to run at Lo for 15 seconds.
- 2) When the humidity thermistor is provided [Optional]
  - a) Operation starts in the cooling mode, and the target relative temperature is determined based on the setting temperature. If the humidity detected by the humidity thermistor becomes lower than the target relative temperature, the indoor unit fan tap is retained.
  - b) Anything other than a) above is same as the item 1) above.

### (d) Timer operation

### 1) Sleep timer

Set the duration of time from the present to the time to turn off the air-conditioner.

It can be selected from 10 steps in the range from "OFF 1 hour later" to "OFF 10 hours later". After the sleep timer setting, the remaining time is displayed with progress of time in the unit of hour.

### 2) OFF times

Time to turn OFF the air-conditioner can be set in the unit of 10 minutes.

### 3) ON timer

Time to turn ON the air-conditioner can be set. Indoor temperature can be set simultaneously.

### 4) Weekly timer

Timer operation (ON timer, OFF timer) can be set up to 4 times a day for each weekday.

# 5) Timer operations which can be set in combination

| ltem ltem    | Sleep timer | OFF timer | ON timer | Weekly timer |  |
|--------------|-------------|-----------|----------|--------------|--|
| Sleep timer  |             | ×         | 0        | ×            |  |
| OFF timer    | ×           | ×         |          | ×            |  |
| ON timer     | 0           | 0         |          | ×            |  |
| Weekly timer | ×           | ×         | ×        |              |  |

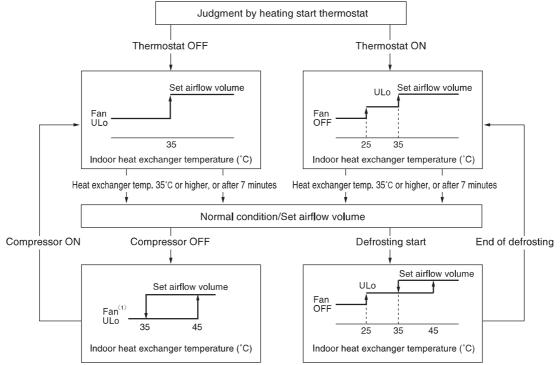

Note (1) ○: Allowed ×: Not

### (e) Remote controller display during the operation stop

- "Centralized control ON" is displayed always on the LCD under the "Center/Remote" and "Center" modes during the operation stop (Power ON). This is not displayed under the "Remote" mode.
- 2) If this display is not shown under the "Center/Remote" mode, check if the indoor unit power switch is turned on or not.

### (f) Hot start (Cold draft prevention at heating)

At the startup of heating operation, at resetting of the thermostat, during defrost operation and at returning to heating, the indoor fan is controlled by the indoor heat exchanger temperature (detected with Thi-R) for preventing the cold draft.

Note (1) Heating preparation is displayed during the hot start (when the compressor is operating and the indoor fan does not provide the set airflow volume).

### (g) Hot keep

Hot keep control is performed at the start of the defrost control.

- 1) Control
  - a) When the indoor heat exchanger temperature (detected with Thi-R1 or R2) drops to 35°C or lower, the speed of indoor fan is changed to the lower tap at each setting.
  - b) During the hot keep, the louver horizontal control signal is transmitted.
- 2) Ending condition

When the indoor fan is at the lower tap at each setting, it returns to the set airflow volume as the indoor heat exchanger temperature rises to 45°C or higher.

### (h) Fan control during the heating thermostat OFF

When the heating thermostat is turned OFF, the setting of the fan control is selectable using the indoor function of wired remote controller [※ FAN CONTROL].

1) Low fan speed (Factory default)

If the indoor heat exchanger temperature drops below 35°C with the heating thermostat OFF, the indoor fan operate at the lower speed tap at each setting.

2) Set fan speed

Even if the indoor heat exchanger temperature drops below 35°C with the heating thermostat OFF, the indoor fan continues to run at the set airflow volume.

3) Intermittence

If the indoor heat exchanger temperature drops below 35°C with the heating thermostat OFF, the indoor fan operates at the lower speed tap at each setting and, when the indoor heater exchanger temperature drops below 25°C, the indoor fan stops for 5 minutes. Then the fan runs at the low speed tap for 2 minutes, and the judgment is made by the thermostat.

4) Fan OFF

If the indoor heat exchanger temperature drops below 35°C with the heating thermostat OFF, the indoor fan is turned OFF. The same applies also when the remote controller sensor is effective.

### (i) Filter sign

As the operation time (Total ON time of ON/OFF switch) accumulates to 180 hours (1), "FILTER CLEANING" is displayed on the remote controller. (This is displayed when the unit is in trouble and under the centralized control, regardless of ON/OFF)

Note (1) Time setting for the filter sign can be made as shown below using the indoor function of wired remote controller "FILTER SIGN SET". (It is set at 1 at the shipping from factory.)

| Filter sign setting | Function                                |
|---------------------|---|
| TYPE 1              | Setting time: 180 hrs (Factory default) |
| TYPE 2              | Setting time: 600 hrs                   |
| TYPE 3              | Setting time: 1,000 hrs                 |
| TYPE 4              | Setting time: 1,000 hrs (Unit stop) (2) |

(2) After the setting time has elapsed, the "FILTER CLEANING" is displayed and, after operating for 24 hours further (counted also during the stop), the unit stops.

### (j) Auto swing control

- 1) Louver control
  - a) Press the "LOUVER" button to operate the swing louver when the air conditioner is operating.
    - "SWING ="" is displayed for 3 seconds and then the swing louver moves up and down continuously.
  - b) To fix the swing louver at a position, press one time the "LOUVER" button while the swing louver is moving so that four stop positions are displayed one after another per second.
    - When a desired stop position is displayed, press the "LOUVER" button again. The display stops, changes to show the "STOP 1——" for 5 seconds and then the swing louver stops.
  - c) Louver operation at the power on with a unit having the louver 4-position control function
    - The louver swings one time automatically (without operating the remote controller) at the power on.
    - This allows inputting the louver motor (LM) position, which is necessary for the microcomputer to recognize the louver position.
    - Note (1) If you press the "LOUVER" button, the swing motion is displayed on the louver position LCD for 10 second. The display changes to the "SWING"—"display 3 seconds later.

### 2) Automatic louver level setting during heating

At the hot start with the heating thermostat OFF, regardless whether the auto swing switch is operated or not (auto swing or louver stop), the louver takes the level position (In order to prevent the cold start). The louver position display LCD continues to show the display which has been shown before entering this control.

### 3) Louver-free stop control

When the louver-free stop has been selected with the indoor function of wired remote controller ">¬¬¬ POSITION", the louver motor stops when it receives the stop signal from the remote controller. If the auto swing signal is received from the remote controller, the auto swing will start from the position where it was before the stop.

Note (1) When the indoor function of wired remote controller ">¬¬ POSITION" has been switched, switch also the remote control function "¬¬¬ POSITION" in the same way.

### 4) Individual flap (louver) control system

Regarding FDTC model, the individual flaps (louvers) for 4 directions can be controlled to swing within the ranges between upper limit and lower limit selected with wired remote controller respectively.

For detail setting method, refer to ⑦ in page 160 for FDTC.

Note (1) This function is not able to be set with wireless remote controller or simple remote controller (RCH-E3)

### (k) Compressor inching prevention control

### 3-minute timer

When the compressor has been stopped by the thermostat, remote controller operation switch or anomalous condition, its restart will be inhibited for 3 minutes. However, the 3-minute timer is invalidated at the power on the electric power source for the unit.

### 3-minute forced operation timer

- Compressor will not stop for 3 minutes after the compressor ON. However, it stops immediately when the unit is stopped by means of the ON/OFF switch or by when the thermister turned OFF the change of operation mode.
- If the thermostat is turned OFF during the forced operation control of heating compressor, the louver position (with the auto swing) is returned to the level position.

Note (1) The compressor stops when it has entered the protective control.

### (I) Drain motor

1) Drain motor (DM) is operated during the cooling or dehumidifying mode operations and simultaneously with the compressor ON. The DM continues to operate for 5 minutes after the operation stop, anomalous stop, thermostat stop or when it was switched from the cooling and dehumidifying operations to the fan or heating operation.

| Indoor unit operation mode |  |  |  |  |  |  |  |
|----------------------------|--|--|--|--|--|--|--|
|                            | Stop (1) Cooling Dehumidifying Fan (2) Heating |  |  |  |  |  |  |
| Compressor ON              | Compressor ON Control A                        |  |  |  |  |  |  |
| Compressor OFF Control B   |  |  |  |  |  |  |  |

Note (1) Including the stop from the cooling, dehumidifying, fan and heating, and the anomalous stop (2) Including the "Fan" operation according to the mismatch of operation modes

### a) Control A

- i) If the float switch detects any anomalous draining condition, the unit stops with the anomalous stop (displays E9) and the drain pump starts. After detecting the anomalous condition, the drain motor continues to be ON.
- ii) It keeps operating while the float switch is detecting the anomalous condition.

### b) Control B

If the float switch detects any anomalous drain condition, the drain motor is turned ON for 5 minutes, and at 10 seconds after the drain motor OFF it checks the float switch. If it is normal, the unit is stopped under the normal mode or, if there is any anomalous condition, E9 is displayed and the drain motor is turned ON. (The ON condition is maintained during the drain detection.)

# 2) Drain motor (DM) interlock control

### a) Start conditions

Depending on the function setting by the remote controller, the drain motor is turned ON under either one of the following conditions.

- i) During heating mode operation (Both the thermostat ON/OFF)
- ii) During heating mode operation (Both the thermostat ON/OFF) + Fan operation
- iii) Fan operation

### b) End conditions

The drain motor is turned OFF 5 minutes after the stop of operations i) to iii) above.

### (m) Operation check/drain pump test run operation mode

- 1) If the power is turned on by the dip switch (SW7-1) on the indoor PCB when electric power source is supplied, it enters the mode of operation check/drain pump test run. It is ineffective (prohibited) to change the switch after turning power on.
- When the communication with the remote controller has been established within 60 seconds after turning power on by the dip switch (SW7-1) ON, it enters the operation check mode. Unless the remote controller communication is established, it enters the drain pump test run mode.

Note (1) To select the drain pump test run mode, disconnect the remote controller connector (CNB) on the indoor PCB to shut down the remote controller communication.

### 3) Operation check mode

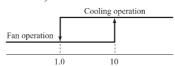

There is no communication with the outdoor unit but it allows performing operation in respective modes by operating the remote controller.

### 4) Drain pump test run mode

As the drain pump test run is established, the drain pump only operates and during the operation protective functions by the microcomputer of indoor unit become ineffective.

### (n) Cooling, dehumidifying frost protection

1) To prevent frosting during cooling mode or dehumidifying mode operation, the of compressor speed is reduced if the indoor heat exchanger temperature (detected with Thi-R) drops to 1.0 °C or lower at 4 minutes after the start of compressor operation. If the indoor unit heat exchanger temperature is 1.0 °C or lower after 20 seconds, the compressor speed is reduced further. If it becomes 2.5 °C or higher, the control terminates. When the indoor heat exchanger temperature has become as show below after reducing the compressor speed, it is switched to the fan operation. For the selection of indoor fan speed, refer to item 2).

Indoor heat exchanger temperature (°C)

### Selection of indoor fan speed

If it enters the frost prevention control during cooling operation (excluding dehumidifying), the indoor unit fan speed is switched.

- a) When the indoor return air detection temperature (detected with Thi-A) is 23°C or higher and the indoor heat exchanger temperature (detected with Thi-R) detects the compressor frequency drop start temperature A°C+1°C, of indoor unit fan speed is increased by 20rpm.
- b) If the phenomenon of i) above is detected again after the acceleration of indoor unit fan, indoor unit fan speed is increased further by 20rpm.

Note (1) Indoor unit fan speed can be increased by up to 2 taps.

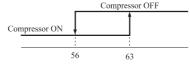

• Compressor frequency drop start temperature

| Symbol Item Symbol                  | A   |
|-------------------------------------|-----|
| Temperature - Low (Factory default) | 1.0 |
| Temperature - High                  | 2.5 |

Note (1) Frost prevention temperature setting can be selected with the indoor unit function setting of the wired remote controller.

### (o) Heating overload protection

1) If the indoor heat exchanger temperature (detected with Thi-R) at 63°C or higher is detected for 2 seconds continuously, the compressor stops. When the compressor is restarted after a 3-minute delay, if a temperature at 63°C or higher is detected for 2 seconds continuously within 60 minutes after initial detection and if this is detected 5 times consecutively, the compressor stops with the anomalous stop (E8). Anomalous stop occurs also when the indoor heat exchanger temperature at 63°C or higher is detected for 6 minutes continuously.

2) Indoor unit fan speed selection

Indoor heat exchanger temperature (°C)

If, after second detection of heating overload protection up to fourth, the indoor fan is set at Me and Lo taps when the compressor is turned ON, the indoor fan speed is increased by 1 tap.

### (p) Anomalous fan motor

After starting the fan motor, if the fan motor speed is 200rpm or less is detected for 30 seconds continuously and 4 times within 60 minutes, then fan motor stops with the anomalous stop (E16).

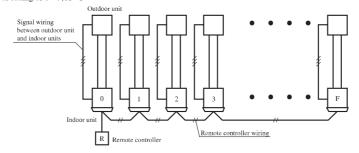

### (q) Plural unit control - Control of 16 units group by one remote controller

### 1) Function

One remote controller switch can control a group of multiple number of unit (Max. 16 indoor units). "Operation mode" which is set by the remote controller switch can operate or stop all units in the group one after another in the order of unit No. (1). Thermostat and protective function of each unit function independently.

Note (1) Unit No. is set by SW2 on the indoor unit control PCB. Unit No. setting by SW2 is necessary for the indoor unit only.

SW2: For setting of 0 - 9, A - F

(2) Unit No. may be set at random unless duplicated, it should be better to set orderly like 0, 1, 2..., F to avoid mistake.

### 2) Display to the remote controller

- a) Center or each remote controller basis, heating preparation: the youngest unit No. among the operating units in the remote mode (or the center mode unless the remote mode is available) is displayed.
- b) Inspection display, filter sign: Any of unit that starts initially is displayed.
- c) Confirmation of connected units

Pressing "AIR CON No." button on the remote controller displays the indoor unit address. If "▲" "▼" button is pressed at the next, it is displayed orderly starting from the unit of youngest No.

- d) In case of anomaly
  - i) If any anomaly occurs on a unit in a group (a protective function operates), that unit stops with the anomalous stop but any other normal units continue to run as they are.
  - ii) Signal wiring procedure

Signal wiring between indoor and outdoor units should be made on each unit same as the normal wiring. For the group control, lay connect with sires wiring between rooms using terminal blocks (X, Y) of remote controller.

Connect the remote controller communication wire separately from the power supply wire or wires of other electric devices (AC220V or higher).

### (r) High ceiling control

In the case of indoor unit installed in a higher ceiling room, the airflow volume mode control can be changed with the wired remote controller indoor unit function "FAN SPEED SET".

| Fan tap       |                | Indoor unit airflow setting      |                    |  |             |  |
|---------------|----------------|----------------------------------|--------------------|--|-------------|--|
|               |                | <b>2011 - 2011 - 2011 - 2011</b> | %all - %al( - %a() | ************************************** | %ati - %ati |  |
| FAN SPEED SET | STANDARD       | PHi - Hi - Me - Lo               | Hi - Me - Lo       | Hi - Lo                                | Hi - Me     |  |
| FAN SPEED SET | HIGH SPEED1, 2 | PHi - PHi - Hi - Me              | PHi - Hi - Me      | PHi - Me                               | PHi - Hi    |  |

Note (1) Factory default is Standard.

- (2) At the hot-start and heating thermostat OFF, or other, the indoor unit fan is operated at the low speed tap of each setting.
- $(3) \ \ This function is not able to be set with wireless remote controller or simple remote controller (RCH-E3)$

# Abnormal temperature thermistor (return air/indoor heat exchanger) wire/short-circuit detection

### 1) Broken wire detection

When the return air temperature thermistor detects -50°C or lower or the heat exchanger temperature thermistor detect -50°C or lower for 5 seconds continuously, the compressor stops. After a 3-minute delay, the compressor restarts but, if it is detected again within 60 minutes after the initial detection for 6 minutes continuously, stops again (the return air temperature thermistor: E7, the heat exchanger temperature thermistor: E6).

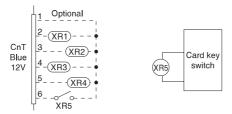

# 2) Short-circuit detection

If the heat exchanger temperature thermistor detects 70°C or higher for 5 seconds continuously at 2 minutes and 20 seconds after the compressor ON during cooling operation, the compressor stops (E6).

### (t) Operation permission/prohibition

### (In case of adopting card key switches or commercially available timers)

When the indoor function setting of wired remote controller for "Operation permission/prohibition" is changed from "Invalid (Factory default)" to "Valid", following control becomes effective.

|       | Normal operation<br>(Factory default) |      | Operation permission/prohibition mode "Valid" (Local setting) |                                       |
|-------|---------------------------------------|------|---|---------------------------------------|
|       | ON                                    | OFF  | ON  | OFF                                   |
| CnT-6 | Operation                             | Stop | Operation permission*1  | Operation prohibition<br>(Unit stops) |

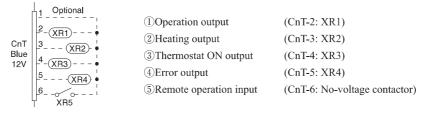

\*1 Only the "LEVEL INPUT" is acceptable for external input, however when the indoor function setting of "Level input (Factory default)" or "Pulse input" is selected by the function for "External input" of the wired remote controller, operation status will be changed as follows.

| In case of "Level input" setting                                      | In case of "Pulse input" setting |
|---|----------------------------------|
| Unit operation from the wired remote controller becomes available*(1) | Unit starts operation *(2)       |

- \*(1) In case that "Operation permission/prohibition mode" setting is "Valid" and "External input" setting is "Level input (Factory default)";
  - When card key switch is ON (CnT-6 ON: Operation permission), start/stop operation of the unit from the wired remote controller becomes available.
  - When card key switch is OFF (CnT-6 OFF: Operation prohibition), the unit stops operation in conjunction with OFF signal, and start/stop operation of the unit from the wired remote controller becomes not available.
- \*(2) In case that "Operation permission/prohibition mode" setting is "Valid" and "External input" setting is "Pulse input (Local setting)";
  - ① When card key switch is ON (Operation permission), the unit starts operation in conjunction with ON signal. and also start/stop operation of the unit from the wired remote controller becomes available.
  - ② When card key switch is OFF (Operation prohibition), the unit stops operation in conjunction with OFF signal, and start/stop operation of the unit from the wired remote controller becomes not available.
- (3) This function is invalid only at "Center mode" setting done by central controller.

### (u) External input/output control (CnT)

Be sure to connect the wired remote controller to the indoor unit. Without wired remote controller remote operation by CnT is not possible to perform.

# 1) Output for external control (remote display)

Following output connectors (CnT) are provided on the indoor control PCB for monitoring operation status.

- ① **Operation output:** Outputs DC12V signal for driving relay during operation
- **2 Heating output:** Outputs DC12V signal for driving relay during heating operation
- 3 Thermostat ON output: Outputs DC12V signal for driving relay when compressor is operating.
- **Triple 1** Error output: Outputs DC12V signal for driving relay when anomalous condition occurs.

### 2) Remote operation input

Remote operation input connector (CnT-6) is provided on the indoor control PCB.

However remote operation by CnT-6 is not effective, when "Center mode" is selected by center controller.

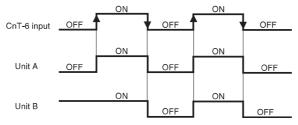

In case of plural unit (twin, triple, double twin), remote operation input to CnT-6 on the slave indoor unit is invalid.

**Only the "LEVEL INPUT" is acceptable for external input**, however when the indoor function setting of "Level input (Factory default)" or "Pulse input" is selected by the function for "External input" of the wired remote controller, operation status will be changed as follows.

### a) In case of "Level input" setting (Factory default)

Input signal to CnT-6 is OFF→ON ...... unit ON Input signal to CnT-6 is ON→OFF ...... unit OFF

Operation is not inverted.

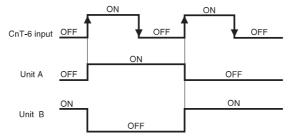

Note: The latest operation has priority

It is available to operate/stop by remote controller or center controller

# b) In case of "Pulse input" setting (Local setting)

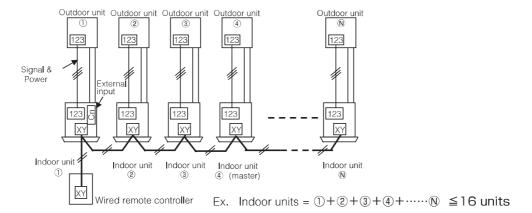

It is effective only when the input signal to CnT-6 is changed OFF→ON, and at that time unit operation [ON/OFF] is inverted.

### 3) Remote operation

### a) In case of multiple units (Max. 16 indoor units group) are connected to one wired remote controller

When the indoor function setting of wired remote controller for "External control set" is changed from "Individual (Factory default)" to "For all units", all units connected in one wired remote controller system can be controlled by external operation input.

|       | Individual operation   | on (Factory default)  | All units operation  | on (Local setting)  |
|-------|--|---|--|---|
|       | ON   | OFF   | ON   | OFF   |
| CnT-6 | Only the unit directly connected to the remote controller can be operated. | Only the unit directly connected to the remote controller can be stopped opeartion. | All units in one remote controller system can be operated. | All units in one remote controller system can be stopped operation. |
|       | Unit 1 only  | Unit ① only   | Units ① – N  | Units ① – 🕦   |

When more than one indoor unit (Max. 16 indoor units) are connected in one wired remote controller system:

- (1) With the factory default, external input to CnT-6 is effective for only the unit ①.
- (2) When setting "For all unit" (Local setting), all units in one remote controller system can be controlled by external input to CnT-6 on the indoor unit ①.
- (3) External input to CnT-6 on the other indoor unit than the unit ① is not effective.

### (v) Fan control at heating startup

1) Start conditions

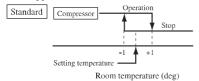

At the start of heating operation, if the difference of setting temperature and return air temperature is 5°C or higher after the end of hot start control, this control is performed.

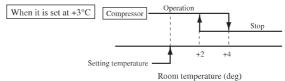

- 2) Contents of control
  - a) Sampling is made at each minute and, when the indoor unit heat exchanger temperature (detected with Th<sub>I</sub>-R) is 37°C or higher, present number of revolutions of indoor unit fan speed is increased by 10min<sup>-1</sup>.
  - b) If the indoor unit heat exchanger temperature drops below 37°C at next sampling, present number of revolutions of indoor unit fan speed is reduced by 10min<sup>-1</sup>.
- 3) End conditions

Indoor fan speed is reduced to the setting airflow volume when the compressor OFF is established and at 30 minutes after the start of heating operation.

### (w) Room temperature detection temperature compensation during heating

With the standard specification, the compressor is turned ON/OFF with the thermostat setting temperature. When the thermostat is likely to turn OFF earlier because the unit is installed at the ceiling where warm air tends to accumulate, the setting can be changed with the wired remote controller indoor unit function "\$\$P OFFSF". The compressor and the heater are turned ON/OFF at one of the setting temperature +3, +2 or +1°C in order to improve the feeling of heating. The setting temperature, however, has the upper limit of 30°C.

# (x) Return air temperature compensation

This is the function to compensate the deviation between the detection temperature by the return air temperature thermistor and the measured temperature after installing the unit.

- 1) It is adjustable in the unit of 0.5°C with the wired remote controller indoor unit function "RETURN AIR TEMP".
  - +1.0°C, +1.5°C, +2.0°C
- -1.0°C, -1.5°C, -2.0°C
- 2) Compensated temperature is transmitted to the remote controller and the compressor to control them.

Note (1) The detection temperature compensation is effective on the indoor unit thermistor only.

# 1.3 Outline of heating operation

### (1) Summary

### (a) Capacity control

### 1) Indoor unit SRK 20~60 ZJX-S models only

| Model    | SCM40ZJ-S    | SCM45ZJ-S    | SCM50ZJ-S    | SCM60ZJ-S    | SCM71ZJ-S    | SCM80ZJ-S    |
|----------|--------------|--------------|--------------|--------------|--------------|--------------|
| Capacity | 1.4 ~ 6.9 kW | 1.4 ~ 7.4 kW | 1.4 ~ 7.5 kW | 1.5 ~ 7.8 kW | 1.5 ~ 9.4 kW | 1.5 ~ 9.8 kW |

### 2) Indoor unit except SRK 20~60 ZJX-S models

| Model    | SCM40ZJ-S    | SCM45ZJ-S    | SCM50ZJ-S    | SCM60ZJ-S    | SCM71ZJ-S    | SCM80ZJ-S    |
|----------|--------------|--------------|--------------|--------------|--------------|--------------|
| Capacity | 1.4 ~ 6.7 kW | 1.4 ~ 7.2 kW | 1.4 ~ 7.3 kW | 1.5 ~ 7.6 kW | 1.5 ~ 9.1 kW | 1.5 ~ 9.5 kW |

Capacity control is within the range shown above. If demand capacity of the indoor units exceeds the maximum capacity of the outdoor unit, the demand capacity will be proportionally distributed.

### (b) Outdoor compressor speed control

| Indoor compressor command total speed value | Decision speed |
|---|----------------|
| 0 rps                                       | 0 rps          |
| A rps or less                               | A rps          |
| More than A rps, but B rps or less          | A rps to B rps |
| More than B rps                             | B rps          |

### • Values of A, B

### (3) Hot keep operation

If the hot keep operation is selected during the heating operation, the indoor fan is controlled based on the temperature of the indoor unit heat exchanger (Th2) to prevent blowing of cool wind.

Note (1) Refer to the FDTC series by 21 page.

### (4) Defrosting operation

- (a) Starting conditions (Defrosting operation can be started only when all of the following conditions are met.)
  - 1) After start of heating operation

When it elapsed 40 minutes. (Accumulated compressor operation time)

2) After end of defrosting operation

When it elapsed 40 minutes. (Accumulated compressor operation time)

3) Outdoor heat exchanger temperature (Th1)

When the temperature has been below -2°C for 3 minutes continuously.

4) The condition of outdoor air temperature (Th1) and the outdoor heat exchanger temperature (Th1)

(Th2)−(Th1)  $\ge$  0.44 × (Th2) + A

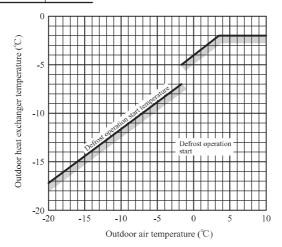

Th2
A

-2 °C  $\le$  Th2
4

-15 °C  $\le$  Th2 < -2 °C

Th2 < -15 °C

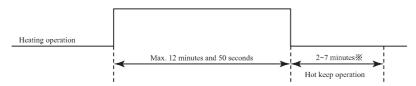

6

# 5) During continuous compressor operation

In addition, when the speed command from the indoor controller of the indoor unit during heating operation has counted 0 rps 10 times or more and all conditions of 1), 2), 3) and 5) above and the outdoor air temperature is 3°C or less are satisfied (note that when the temperature for outdoor heat exchanger sensor (Th1) is -2°C or less: 62 rps or more, -2°C or less: less than 62 rps), defrost operation is started.

- (b) Ending conditions (Operation returns to the heating cycle when either one of the following is met.)
  - 1) Outdoor heat exchanger sensor (Th1) temperature: 20°C or higher
  - 2) Outdoor heat exchanger sensor (Th1) temperature: 2 min. as for 10°C (model 71, 80: 1 min. as for 18°C)
  - 3) Continued operation time of defrosting  $\rightarrow$  For more than 12 minutes and 50 seconds

 $\divideontimes$  Depends on an operation condition, the time can be longer than 7 minutes

# 1.4 Outline of cooling operation

### (1) Summary

### (a) Capacity control

### 1) Indoor unit SRK xx ZJX-S models only

| Model    | SCM40ZJ-S    | SCM45ZJ-S    | SCM50ZJ-S    | SCM60ZJ-S    | SCM71ZJ-S    | SCM80ZJ-S    |

# 1.5 Outline of automatic operation

### (1) SRK 20~60ZJX-S, SRF and SRR series

# (a) Determination of operation mode

The unit checks the indoor air temperature and the outdoor air temperature after operating the indoor and outdoor blowers for 20 seconds, determines the operation mode and the indoor air temperature setting correction value, and then enters in the automatic operation.

- (b) The unit checks the temperature every hour after the start of operation and, if the result of check is not same as the previous operation mode, changes the operation mode.
- (c) When the unit is started again within one hour after the stop of automatic operation or when the automatic operation is selected during heating, cooling or dehumidifying operation, the unit is operated in the previous operation mode.
- (d) Setting temperature can be adjusted within the following range. There is the relationship as shown below between the signals of the wireless remote controller and the setting temperature.

♦ SRF series

### (2) SRK 20~50ZJ-S series

### (a) Determination of operation mode

The unit checks the indoor air temperature and setting temperature and the outdoor air temperature, determines the operation mode, and then begins in the automatic operation.

- (b) The unit checks the temperature every hour after the start of operation and, if the result of check is not same as the previous operation mode, changes the operation mode.
  - 1) If the setting temperature is changed with the remote controller, the operation mode is judged immediately.
  - 2) When both the indoor and the outdoor air temperatures are in the range "A", cooling or heating is switched depending on the difference between the setting temperature and the indoor air temperature.
  - 3) When the operation mode has been judged following the change of setting temperature with the remote controller, the hourly judgment of operation mode is cancelled.
- (c) When the unit is started again within one hour after the stop of automatic operation or when the automatic operation is selected during heating, cooling or dehumidifying operation, the unit is operated in the previous operation mode.
- (d) Setting temperature can be adjusted within the following range. There is the relationship as shown below between the signals of the wireless remote controller and the setting temperature.

|                        |               |    |    |    |     |           |          |        |         |          |      |    |    | Unit: °C |

# (3) FDTC series

Refer to page 19.

# 1.6 Operation permission/prohibition control

### (Refer to the FDTC series by 25 page)

The air conditioner operation is controlled by releasing the jumper wire (J3) on the indoor PCB and inputting the external signal into the CnT.

Note (1) Please install the separately-sold Interface kit (SC-BIK-E). Remove the jumper wire (J1 or J3) from the Interface kit circuit board.

# (1) The operation mode is switched over between Permission and Prohibition by releasing the jumper wire (J3) on the indoor PCB,

| When the jumper wire (J3) is short circuited            | When the jumper wire (J3) is released                |
|---|--|
| Normal operation is enable (when shipping)              | Permission / Prohibition mode                        |
| When CnT input is set to ON, the operation starts       | When Cnt input is set to ON, the operation mode is   |
| and if the input is set to OFF, the operation stops.    | changed to permission and if input is set to OFF the |
| For the CnT and remote control inputs, the input        | operation is prohibited.                             |
| which is activated later has priority and can start and |  |
| stop the operation.                                     |  |

### (2) In the case of CnT input ON (Operation permission)

- (a) The air conditioner can be operated or stopped by the remote control signal.(When the "CENTER" mode is set, the operation can be controlled only by the center input.)
- (b) When the CnT input is changed from OFF to ON, the air conditioner operation mode is changed depending on the status of the jumper wire (J1) on the indoor control board.

| When the jumper wire (J1) is short circuited     | When the jumper wire (J1) is released                  |
|--|--|
| The signal (1) above starts the air conditioner. | When the CnT input is set to ON, the air conditioner   |
| (Shipping status)                                | starts operation. After that, the operation of the air |
|  | conditioner depends on (a) above. (Local status)       |

### (3) In the case of CnT input OFF (Operation prohibition)

- (a) Air-conditioner is unable to control the operation/stop, ect. in accordance with signals from the remote controller signal wire
- (b) Air-conditioner stops as it changes CnT input ON  $\rightarrow$  OFF.

# 1.7 External control (remote display)/control of input signal

(Refer to the FDTC series by 25 page)

### (1) External control (remote display) output

Following output connectors (CNT) are provided on the printed circuit board of indoor unit.

Note (1) Please install the separately-sold Interface kit (SC-BIK-E). The output connector (CNT) is located on the circuit board of the Interface kit.

- Operation output: Power to engage DC 12V relay (provided by the customer) is outputted during operation.
- Heating output: Power to engage DC 12V relay (provided by the customer) is outputted during the heating operation.
- Compressor OPERATION output: Power to engage DC 12V relay (provided by the customer) is outputted while the compressor is operating.
- MALFUNCTION output: When any error occurs, the power to engage DC 12V relay (provided by the customer) is outputted.

### (2) Control of input signal

Control of input signal (switch input, timer input) connectors (CNT) are provided on the printed circuit board of indoor unit. However, when the operation of air conditioner is under the Center Mode, the remote control by CnT is invalid.

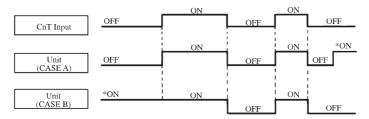

### (a) Level input

If the factory settings (Jumper wire J1 EXTERNAL INPUT on the PCB of indoor unit) are set, or "LEVEL INPUT" is selected in the wired remote control's indoor unit settings.

1) Input signal to CnT OFF  $\rightarrow$  ON

Air conditioner ON

- 2) Input signal to CnT ON  $\rightarrow$  OFF
- Air conditioner OFF

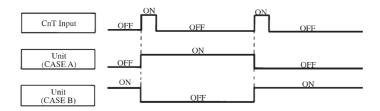

Note (1) The ON with the \* mark indicates an ON operation using the remote control unit switch, etc.

### (b) Pulse input

When Jumper wire J1 on the PCB of indoor unit is cut at the field or "PULSE INPUT" is selected in the wired remote control's indoor unit settings.

Input signal to CnT becomes valid at OFF → ON only and the motion of air conditioner [ON/OFF] is inverted.

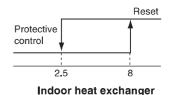

# 1.8 Protective control function

- (1) Frost prevention control (During cooling or dehumidifying)
  - (a) Operating conditions
    - Indoor heat exchanger temperature (Th2) is lower than 2.5°C.
    - 8 minutes after reaching the compressor command speed except 0 rps.

### (b) Detail of anti-frost operation

| Operation mode       | Protective control        | Reset                     |  |  |
|----------------------|---------------------------|---------------------------|--|--|
| Compressor operation | Forced outage             | Operation instruction     |  |  |
| Indoor fan           | Depends on operation mode | Depends on operation mode |  |  |

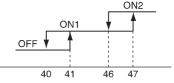

temperature (°C)

- (c) Reset conditions: The indoor heat exchanger temperature (Th2) is 8°C or higher.

# (2) Cooling overload protective control

(a) Operating conditions: When the outdoor air temperature (TH2) has become continuously for 30 seconds at 41°C or more, or 47°C or more with the compressor running, the lower limit speed of compressor is brought up.

|                         | 0 1          |                |  |  |  |  |
|-------------------------|--------------|----------------|--|--|--|--|
| Model                   |              | SCM 40~80 ZJ-S |  |  |  |  |
| Item                    |              |                |  |  |  |  |
| Outdoor air temperature | 41°C or more | 47°C or more   |  |  |  |  |
| Lower limit speed       | 30 rps       | 40 rps         |  |  |  |  |

Outdoor air temperature (°C)

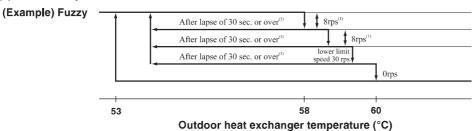

### (b) Detail of operation

The lower limit of compressor command speed is set to 30 or 40 rps and even if the calculated result becomes lower than that after fuzzy calculation, the speed is kept to 30 or 40 rps. However, when the thermo becomes OFF, the speed is reduced to 0

- (c) Reset conditions: When either of the following condition is satisfied.
  - 1) The outdoor air temperature is lower than 40°C.
  - 2) The compressor command speed is 0 rps.

### (3) Cooling high pressure control

- (a) Purpose: Prevents anomalous high pressure operation during cooling.
- **(b) Detector:** Outdoor heat exchanger sensor (Th1)
- (c) Detail of operation:

Notes (1) When the outdoor heat exchanger temperature is in the range of 58~60°C, the compressor command speed is reduced by 8 rps at each 20 seconds.

(2) When the temperature is 60°C or higher, the compressor is stopped.

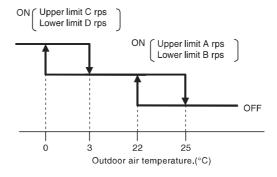

- when the outdoor heat exchanger temperature is in the range of 53~58°C, if the compressor command speed is been maintained and the operation has continued for more than 30 seconds at the same speed, it returns to the normal cooling operation.

### (4) Cooling low outdoor temperature protective control

(a)Operating conditions: When the outdoor air temperature (Th2) is 22°C or lower continues for 20 seconds while compressor command speed is other than 0 rps.

### (b) Detail of operation:

- ① The lower limit of compressor command speed is set to B or D rps and even if the speed becomes lower than B or D rps, the speed is kept to B or D rps. However, when the thermo becomes OFF, the speed is reduced to 0 rps.
- 2 The upper limit of compressor command speed is set to A or C rps, the speed is kept to A or C rps.

### • Values of A ~ D

| Model           | SCM40ZJ-S | SCM45ZJ-S | SCM50ZJ-S | SCM60ZJ-S | SCM71ZJ-S | SCM80ZJ-S |
|-----------------|-----------|-----------|-----------|-----------|-----------|-----------|
| А               | 75 rps    |
| В               | 35 rps    | 35 rps    | 35 rps    | 30 rps    | 30 rps    | 30 rps    |
| С               | 60 rps    |
| <b>D</b> 45 rps |           | 45 rps    | 45 rps    | 40 rps    | 40 rps    | 40 rps    |

- (c) Reset conditions: When the either of the following condition is satisfied
  - ① When the outdoor air temperature (Th2) becomes 25°C or higher.
  - When the compressor command speed is 0rps.

### (5) Heating high pressure control

### (a) Indoor unit side

1) **Start condition:** When the indoor heat exchanger temperature (Th2) has become higher than the start temperature for 1 minute continuously.

### 2) Contents of control: Compressor stop

| Indoor<br>air temp.(Th1) | Release temperature | Start temperature |
|--------------------------|---------------------|-------------------|
| Th1 ≦ 24°C               | 48.5°C              | 62°C              |
| 24°C < Th1≦27°C          | 47.5°C              | 61°C              |
| 27°C < Th1               | 46.5°C              | 60°C              |

3) Release condition: When the indoor heat exchanger temperature (Th2) has become lower than the release temperature.

### (b) Outdoor unit side

1) **Start condition:** When the indoor heat exchanger temperature (Th2) has risen to a specified temperature while the compressor is turned on.

# Compressor command speed is controlled according to the zones of indoor heat exchanger temperature as shown by the following table.

|                               | Th2 < P1 | P1 ≦ Th2 < P2 | P2 ≦ Th2 < P3 | P3 ≦ Th2 |
|-------------------------------|----------|---------------|---------------|----------|
| Protection control speed (NP) | Normal   | Retention     | NP-4rps       | NP-8rps  |
| Sampling time (s)             | Normal   | 20            | 20            | 20       |

| • Model SCM40~50 Unit: °C |         |         |           |  |
|---------------------------|---------|---------|-----------|--|
| NP Th2                    | P1      | P2      | P3        |  |
| 10 ≦ NP < 115             | 45      | 52      | 57.5      |  |
| 115 ≦ NP < 120            | 45 ~ 43 | 52 ~ 50 | 57.5 ~ 55 |  |
| 120 ≦ NP                  | 43      | 50      | 55        |  |

| • Model SCM60~80 |           |             | Unit: °C |
|------------------|-----------|-------------|----------|
| NP Th2           | P1        | P2          | Р3       |
| 10 ≦ NP < 90     | 45        | 52          | 57       |
| 90 ≦ NP < 100    | 45 ~ 44.5 | 52 ~ 49.5   | 57 ~ 54  |
| 100 ≦ NP < 110   | 44.5 ~ 44 | 49.5 ~ 47.5 | 54 ~ 51  |
| 110 ≦ NP < 120   | 44 ~ 43   | 47.5 ~ 45   | 51 ~ 48  |
| 120 ≦ NP         | 43        | 45          | 48       |

### (6) Heating overload protective control

### (a) Indoor unit side

1) **Operating conditions**: When the outdoor air temperature (Th2) is 17°C or higher continues for 30 seconds while the compressor command speed other than 0 rps.

2) Detail of operation: The indoor fan is stepped up by 1 speed step. [Upper limit 8th (SRF, SRR:9th, FDTC:4th) speed]

3) Reset conditions: The outdoor air temperature (Th2) is lower than 16°C.

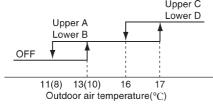

### (b) Outdoor unit side

1) Operating conditions: When the outdoor air temperature (Th2) is  $10^{\circ}$ C or  $17^{\circ}$ C (model  $60 \sim 80:13^{\circ}$ C or  $17^{\circ}$ C) or higher continues for 30 seconds while the compressor command speed other than 0 rps.

### 2) Detail of operation

- a) Taking the upper limit of compressor command speed range at A or C, if the output speed obtained with the fuzzy calculation exceeds the upper limit, the upper limit value is maintained.
- b) The lower limit of compressor command speed is set to B or D and even if the calculated result becomes lower than that after fuzzy calculation, the speed is kept to B or D. However, when the thermo becomes OFF, the speed is reduced to 0 prs.
- c) Inching prevention control is activated and inching prevention control is carried out with the minimum speed set at B or D.

3) Reset conditions: The outdoor air temperature (Th2) is lower than  $8^{\circ}$ C (model  $60 \sim 80:11^{\circ}$ C).

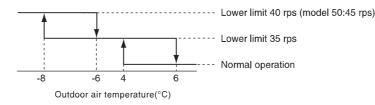

|               |    |    |    | Unit: rps |
|---------------|----|----|----|-----------|
| Model Item    | Α  | В  | С  | D         |
| SCM40, 45     | 90 | 35 | 75 | 40        |
| SCM50         | 90 | 35 | 75 | 40        |
| SCM60, 71, 80 | 90 | 30 | 75 | 40        |

Note(1) Value in ( ) are for the model SCM40, 45.

### (7) Heating low outdoor temperature protective control

- (a) Operating conditions: When the outdoor air temperature (Th2) is lower than 4°C or higher continues for 30 seconds while the compressor command speed is other than 0 rps.
- (b) Detail of operation: The lower limit compressor command speed is change as shown in the figure below.

- (c) Reset conditions: When either of the following condition is satisfied.
  - 1) The outdoor air temperature (TH2) becomes 6°C.
  - 2) The compressor command speed is 0 rps.

### (8) Freezing cycle system protective control

- (a) Starting condition: This control starts when the following conditions are met.
  - 1) When it has elapsed 30 minutes after the compressor was changed from OFF to ON in the cooling operation mode for more than 5 minutes.
  - 2) When the compressor command speed has met the following conditions.
  - 3) When the indoor air temperature of running indoor unit (Th1) and the indoor heat exchanger temperature (Th2) have met the following condition even on one unit.

| Unit | Compressor command speed | Indoor air temperature<br>(Th1, °C ) | Indoor air temperature (Th1) and indoor heat exchanger temperature (Th2) | Duration |
|------|--------------------------|--------------------------------------|--|----------|
| 1    | 40 (60) rps              |                                      | Th1 - 4 < Th2  |          |
| 2    | 50 (70) rps              | 10 ≤ Th1 ≤ 40                        | 1111 - 4 < 1112  | 5 minute |
| 3    | 60 (80) rps              | 10 = 101 = 40                        | Th1 - 3 < Th2  | 3 minute |
| 4    | 70 rps                   |                                      | Th1 - 2 < Th2  |          |

Note (1) Value in ( ) are for the model 40 - 50.

### (b) Contents of control

- 1) Stop the compressor and delay the start, and then restarts.
- 2) Compressor stops by the abnormal stop when the compressor stop has occurred 3 times in one hour.

### (9) Crankcase heater

- (a) Operating conditions (When all the conditions below are satisfied)
  - ① After the operation mode is changed to stop and the compressor command speed becomes 0 rps continuously for 30 minutes.
  - 2 When the temperature detected by the outdoor air temperature (Th2) is 10°C or lower after the compressor stops.

#### (b) Detail of operation

The crankcase heater operates, warming up the compressor, then refrigerant begins circulating smoothly when the cooler starts its heating operation, and heating begins.

### (c) Restoration conditions

When the temperature detected by the outdoor air temperature (Th2) reaches 12°C or higher, or the operation mode changes from stop to cooling or heating.

#### (10) Inching prevention

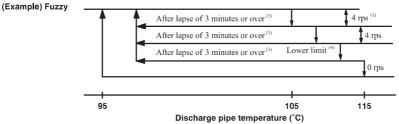

When the compressor becomes to the thermo operation within 5 minutes since operation start or becomes dehumidifying operation, the operation is continued with the compressor command speed of minimum rps forcibly.

### (11) Compressor overheat protection

(a) **Purpose:** It is designed to prevent deterioration of oil, burnout of motor coil and other trouble resulting from the compressor overheat.

### (b) Detail of operation

1) Speeds are controlled with temperature detected by the sensor (Th3) mounted on the discharge pipe.

Notes (1) When the discharge pipe temperature is in the range of 105~115°C, the speed is reduced by 4 rps.

- (2) When the discharge pipe temperature is raised and continues operation for 20 seconds without changing, then the speed is reduced again by 4 rps.
- (3) If the discharge pipe temperature is in the range of 95~105°C even when the compressor command speed is maintained for 3 minutes when the temperature is in the range of 95~105°C, the speed is raised by 1 rps and kept at that speed for 3 minutes. This process is repeated until the command speed is reached.
- (4) Lower limit speed

| Model              | Item    | Cooling | Heating |
|--------------------|---------|---------|---------|
| Lower limit speed  | 40 ~ 50 | 32 rps  | 32 rps  |
| Lower Illint speed | 60 ~ 80 | 25 rps  | 32 rps  |

2) If the temperature of 115°C is detected by the sensor on the discharge pipe, then the compressor will stop immediately. When the discharge pipe temperature drops and the time delay of 3 minutes is over, the unit starts again within 1 hour but there is no start at the third time.

### (12) Current safe

- (a) Purpose: Current is controlled not to exceed the upper limit of the setting operation current.
- **(b) Detail of operation:** Input current to the converter is monitored with the current sensor fixed on the printed circuit board of the outdoor unit and, if the operation current value reaches the limiting current value, the compressor command speed is reduced.

If the mechanism is actuated when the compressor command speed is less than 30 rps, the compressor is stopped immediately. Operation starts again after a delay time of 3 minutes.

# (c) Current safe control value: Set this using the jumper wire (J1 or J2) on the outdoor PCB. Control starts when it exceeds the control value.

### 1) Switching with jumper wire

|                  |  | Jumper wire (J2)                            |                |  |
|------------------|--|---|----------------|--|
|                  |  | Short-circuit<br>(At shipping from factory) | Short-circuit  |  |

| SCM 71, 80ZJ - S     | 13.0           | 16.0    | 10.0    | 10.0    | 7.5            | 7.5     |

### (13) Current cut

- (a) Purpose: Inverter is protected from overcurrent.
- **(b) Detail of operation:** Output current from the inverter is monitored with a shunt resistor and, if the current exceeds the setting value, the compressor is stopped immediately. Operation starts again after a delay time of 3 minutes.

### (14) Outdoor unit failure

This is a function for determining when there is trouble with the outdoor unit during air conditioning.

The compressor is stopped if any one of the following in item (a), (b) is satisfied. Once the unit is stopped by this function, it is not restarted

- (a) When the input current is measured at 1 A or less for 3 continuous minutes or more.
- (b) If the compressor command sends a 0 rps signal to the indoor unit 3 times or more within 20 minutes of the power being turned on.

### (15) Indoor fan motor protection (Refer to the FDTC series by 23 page)

When the air conditioner is operating and the indoor fan motor is turned ON, if the indoor fan motor has operated at 300 (SRF:150) rpm or under for more than 30 seconds, the unit enters first in the stop mode and then stops the entire system.

### (16) Discharge pipe sensor disconnection protection control

- (a) When the compressor command speed is other than 0 rps.
  - 1) Th3(10)-Th3(0) < 8 °C, and Th3(10)-Th2(10) < 5 °C

The compressor command speed is set on A rps for 5 minutes. After 5 minutes, the compressor command speed is set on B rps for 5 minutes.

2) Th3(20)-Th3(15) < 5 °C:

The compressor command speed is set on 0 rps.

- **(b)** Once the unit is stopped by this function, it is not restarted.
- Notes (1) Th3(X): After compressor operation, the discharge pipe sensor temperature after X minutes.
  - (2) Th2(X): After compressor operation, the outdoor air sensor temperature after X minutes

### · Values of A, B

| Model | SCM40ZJ-S | SCM45ZJ-S | SCM50ZJ-S | SCM60ZJ-S | SCM71ZJ-S | SCM80ZJ-S |
|-------|-----------|-----------|-----------|-----------|-----------|-----------|
| Α     | 30 rps    | 30 rps    | 30 rps    | 20 rps    | 20 rps    | 20 rps    |
| В     | 60 rps    |

### (17) Regulation of outdoor air flow

(a) The fan operates as follows according to the compressor command speed. (Except during defrost.)

### ♦SCM40~60ZJ-S

|                             | Cod                    | oling                | Heating                |                      |  |

(b) If the outdoor unit's fan speed drops, the outdoor fan is run for 1 minute at that speed.

#### (18) Serial signal transmission error protection

- (a) **Purpose:** Prevents malfunction resulting from error on the indoor  $\leftrightarrow$  outdoor signals.
- (b) Detail of operation: If the compressor is operating and a serial signal cannot be received from the indoor control with outdoor control having serial signals continues for 7 minute and 35 seconds, the compressor is stopped

After the compressor has been stopped, it will be restarted after the compressor start delay if a serial signal can be received again from the indoor control.

### (19) Rotor lock

If the motor for the compressor does not turn after it has been started, it is determined that a compressor lock has occurred and the compressor is stopped.

### (20) Outdoor fan motor protection

If the outdoor fan motor has operated at 75 rpm or under for more than 30 seconds, the compressor and fan motor are stopped.

### (21) Outdoor fan control at low outdoor temperature

- Cooling
- (a) Operating conditions: When the outdoor air temperature (Th2) is 22°C or lower continues for 30 seconds while the compressor command speed is other than 0 rps.
- **(b) Detail of operation:** After the outdoor fan operates at A speed for 60 seconds; the corresponding outdoor heat exchanger temperature shall implement the following controls.

### • Value of A

|                                | Outdoor fan |
|--------------------------------|-------------|
| Outdoor air temperature > 10°C | 2nd speed   |
| Outdoor air temperature ≦ 10°C | 1st speed   |

1) Outdoor heat exchanger temperature (Th1) ≤ 22°C

After the outdoor fan speed drops (down) to 1 speed for 60 seconds; if the outdoor heat exchanger temperature is lower than 22°C, gradually reduce the outdoor fan speed by 1 speed.

### • lower limit speed

|                                | Lower limit speed |
|--------------------------------|-------------------|
| Outdoor air temperature > 16°C | 2nd speed         |
| Outdoor air temperature ≦ 16°C | 1st speed         |

2)  $22^{\circ}$ C < Outdoor heat exchanger temperature (Th1)  $\leq 40^{\circ}$ C

After the outdoor fan speed maintains at A speed for 20 seconds; if the outdoor heat exchanger temperature is 22°C~ 40°C, maintain outdoor fan speed.

3) Outdoor heat exchanger tempeature (Th1) > 40°C

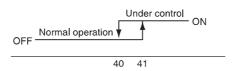

After the outdoor fan speed rises (up) to 1 speed for 60 seconds; if the outdoor heat exchanger temperature is higher than 40°C, gradually increase outdoor fan speed by 1 speed. (Upper limit 4th (model 71,80:3rd) speed)

- (c) Reset conditions: When either of the following conditions is satisfied
  - 1) The outdoor air temperature (Th2) is 24°C or higher.
  - 2) The compressor command speed is 0 rps.

- ♦ Heating
- (a) Operating conditions: When the outdoor air temperature (Th2) is 3°C or lower continues for 30 seconds while the compressor command speed is other than 0 rps.
- (b) Detail of operation: The outdoor fan is stepped up by 1 speed. (Upper limit 7th speed)
- (c) Reset conditions: When either of the following conditions is satisfied
  - 1) The outdoor air temperature (Th2) is 5°C or higher.
  - 2) The compressor command speed is 0 rps.

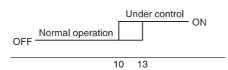

### (22) Outdoor unit fan control at overload

- ♦ Cooling
- (a) Start condition: When the outdoor air temperature (Th2) has risen higher than 41°C for 30 seconds continuously while the compressor is operating.

Outdoor air temperature(°C)

- (b) Contents of control: The outdoor unit fan tap is brought up by 3 steps (Higher limit is 6th tap.)
- (c) Release condition: When the compressor is turned off or the outdoor heat exchanger temperature (Th1) has dropped lower than 40°C.
- ♦ Heating
- (a) Start condition: When the outdoor air temperature (Th2) has risen higher than 13°C for 30 seconds continuously while the compressor is operating.

Outdoor heat exchanger temperature(°C)

- (b) Contents of control: The outdoor unit fan tap is brought down by 3 steps (Lower limit is 2nd tap.)
- (c) Release condition: When the compressor is turned off or the outdoor heat exchanger temperature (Th1) has dropped lower than 10°C.

### 2 MAINTENANCE DATA

### 2.1 SRK, SRF and SRR series

### (1) Cautions

- (a) If you are disassembling and checking an air conditioner, be sure to turn off the power before beginning. When working on indoor units, let the unit sit for about 1 minute after turning off the power before you begin work. When working on an outdoor unit, there may be an electrical charge applied to the main circuit (electrolytic condenser), so begin work only after discharging this electrical charge (to DC 10 V or lower).
- (b) When taking out printed circuit boards, be sure to do so without exerting force on the circuit boards or package components.
- (c) When disconnecting and connecting connectors, take hold of the connector housing and do not pull on the lead wires.

### (2) Items to check before troubleshooting

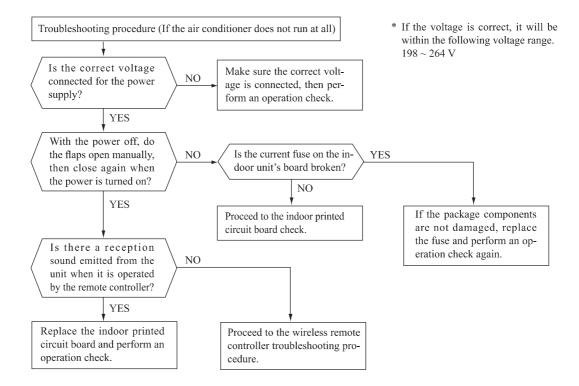

- (a) Have you thoroughly investigated the details of the trouble which the customer is complaining about?
- (b) Is the air conditioner running? Is it displaying any self-diagnosis information?
- (c) Is a power supply with the correct voltage connected?
- (d) Are the control lines connecting the indoor and outdoor units wired correctly and connected securely?
- (e) Is the outdoor unit's service valve open?

### (3) Troubleshooting procedure (If the air conditioner does not run at all)

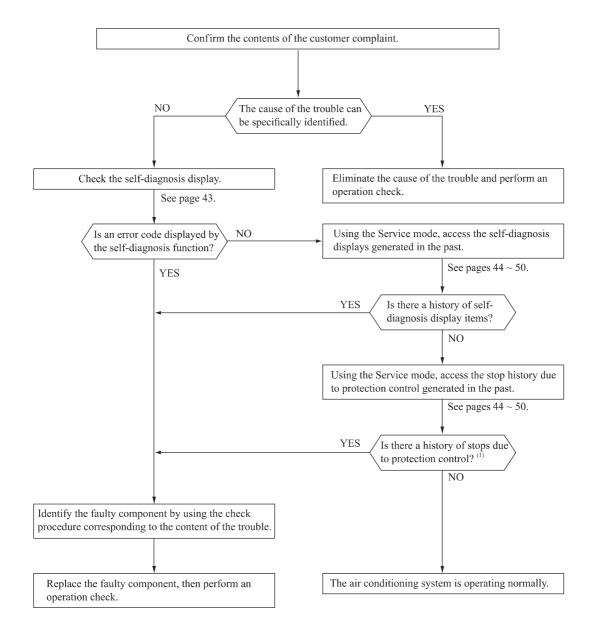

If the air conditioner does not run at all, diagnose the trouble using the following troubleshooting procedure. If the air conditioner is running but breaks down, proceed to troubleshooting step (4).

**Important** When all the following conditions are met, we say that the air conditioner will not run at all.

- (a) The RUN light does not light up.
- (b) The flaps do not open.
- (c) The indoor unit fan motors do not run.
- (d) The self-diagnosis display does not function.

### (4) Troubleshooting procedure (If the air conditioner runs)

Note (1) Even in cases where only intermittent stop data are generated, the air conditioning system is normal. However, if the same protective operation recurs repeatedly (3 or more times), it will lead to customer complaints. Judge the conditions in comparison with the contents of the complaints.

### (5) Self-diagnosis table

When this air conditioner performs an emergency stop, the reason why the emergency stop occurred is displayed by the flashing of display lights. If the air conditioner is operated using the remote controller 3 minutes or more after the emergency stop, the trouble display stops and the air conditioner resumes operation. (1)

Notes (1)The air conditioner cannot be restarted using the remote controller for 3 minutes after operation stops. (2)The wired remote controller is optional parts. (3)SRR series only.

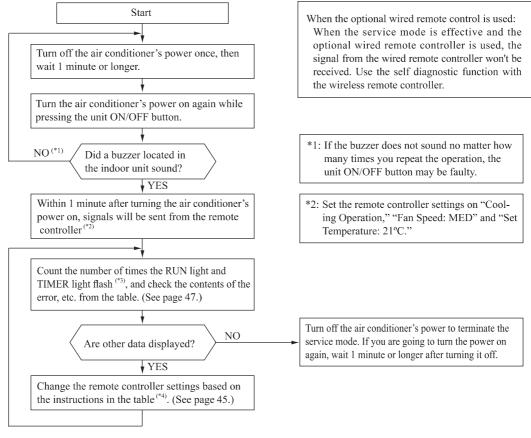

### (6) Service mode (Trouble mode access function)

This air conditioner is capable of recording error displays and protective stops (service data) which have occurred in the past. If self-diagnosis displays cannot be confirmed, it is possible to get a grasp of the conditions at the time trouble occurred by checking these service data.

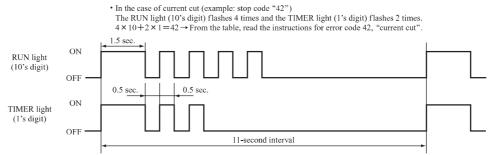

### (a) Explanation of terms

| Term                | Explanation   |
|---------------------|---|
| Service mode        | The service mode is the mode where service data are displayed by flashing of the display lights when the operations in item (b) below are performed with the indoor controller.   |
| Service data        | These are the contents of error displays and protective stops which occurred in the past in the air conditioner system. Error display contents and protective stop data from past anomalous operations of the air conditioner system are saved in the indoor unit controller's non-volatile memory (memory which is not erased when the power goes off). There are two types of data, self-diagnosis data and stop data, described below.   |
| Self-diagnosis data | These are the data which display the reason why a stop occurred when an error display(self-diagnosis display) occurred in an indoor unit. Data are recorded for up to 5 previous occurrences. Data which are older than the 5th previous occurrence are erased.  In addition, data on the temperature of each sensor (room temperature, indoor heat exchanger, outdoor heat exchanger, outdoor heat exchanger, outdoor switching, fan speed switching) are recorded when trouble occurs, so more detailed information can be checked.   |
| Stop data           | These are the data which display the reason by a stop occurred when the air conditioning system performed protective stops, etc. in the past. Even if stop data alone are generated, the system restarts automatically. (After executing the stop mode while the display is normal, the system restarts automatically.) Data for up to 10 previous occasions are stored. Data older than the 10th previous occasion are erased.  (Important) In cases where transient stop data only are generated, the air conditioner system may still be normal. However, if the same protective stop occurs frequently (3 or more times), it could lead to customer complaints. |

### (b) Service mode display procedure

\*3: To count the number of flashes in the service mode, count the number of flashes after the light lights up for 1.5 second initially (start signal). (The time that the light lights up for 1.5 second (start signal) is not counted in the number of flashes.)

\*4: When in the service mode, when the remote controller settings (operation switching, fan speed switching, temperature setting) are set as shown in the following table and sent to the air conditioner unit, the unit switches to display of service data.

### 1) Self-diagnosis data

What are Self-......These are control data (reasons for stops, temperature at each sensor, remote controller information) diagnosis Data? from the time when there were error displays (abnormal stops) in the indoor unit in the past.

Data from up to 5 previous occasions are stored in memory. Data older than the 5th previous occasion are erased.

The temperature setting indicates how many occasions previous to the present setting the error display data are and the operation switching and fan speed switching data show the type of data.

| Remote controller setting |                     | Contents of output data   |  |  |  |  |  |  |
|---------------------------|---------------------|---|--|--|--|--|--|--|
| Operation switching       | Fan speed switching | Contents of output data   |  |  |  |  |  |  |
|                           | MED                 | Displays the reason for stopping display in the past (error code).  |  |  |  |  |  |  |
| Cooling HI                |                     | splays the room temperature sensor temperature at the time the error code was displayed in the past.          |  |  |  |  |  |  |
|                           | AUTO                | Displays the indoor heat exchanger sensor temperature at the time the error code was displayed in the past.   |  |  |  |  |  |  |
| LO                        |                     | Displays the remote controller information at the time the error code was displayed in the past.              |  |  |  |  |  |  |
| MED                       |                     | Displays the outdoor air temperature sensor temperature at the time the error code was displayed in the past. |  |  |  |  |  |  |
| Heating                   | HI                  | Displays the outdoor heat exchanger sensor temperature at the time the error code was displayed in the past.  |  |  |  |  |  |  |
|                           | AUTO                | Displays the discharge pipe sensor temperature at the time the error code was displayed in the past.          |  |  |  |  |  |  |

| Remote controller setting | Indicates the number of occasions previous to the present |
|---------------------------|---|
| Temperature setting       | the error display data are from.                          |
| 21°C                      | 1 time previous (previous time)                           |
| 22°C                      | 2 times previous  |
| 23°C                      | 3 times previous  |
| 24°C                      | 4 times previous  |
| 25°C                      | 5 times previous  |

### Only for indoor heat exchanger sensor 2

| Remote controller setting | Indicates the number of occasions previous to the present |  |  |  |  |  |
|---------------------------|---|--|--|--|--|--|
| Temperature setting       | the error display data are from.                          |  |  |  |  |  |
| 26°C                      | 1 time previous (previous time)                           |  |  |  |  |  |
| 27°C                      | 2 times previous  |  |  |  |  |  |
| 28°C                      | 3 times previous  |  |  |  |  |  |
| 29°C                      | 4 times previous  |  |  |  |  |  |
| 30°C                      | 5 times previous  |  |  |  |  |  |

### (Example)

| Remo                | te controller | setting |   |
|---------------------|---------------|---------|---|
| Operation switching |               |         | Displayed data  |
|                     |               | 21°C    | Displays the reason for the stop (error code) the previous time an error was displayed.     |
|                     |               |         | Displays the reason for the stop (error code) 2 times previous when an error was displayed. |
| Cooling             |               |         | Displays the reason for the stop (error code) 3 times previous when an error was displayed. |
|                     |               | 24°C    | Displays the reason for the stop (error code) 4 times previous when an error was displayed. |
|                     |               | 25°C    | Displays the reason for the stop (error code) 5 times previous when an error was displayed. |

### 2) Stop data

| Remo                | Remote controller setting |                     |   |
|---------------------|---------------------------|---------------------|---|
| Operation switching | Fan speed switching       | Temperature setting | Displayed data  |
|                     |                           | 21°C                | Displays the reason for the stop (stop code) the previous time when the air conditioner was stopped by protective stop control. |
|                     |                           | 22°C                | Displays the reason for the stop (stop code) 2 times previous when the air conditioner was stopped by protective stop control.  |
|                     |                           | 23°C                | Displays the reason for the stop (stop code) 3 times previous when the air conditioner was stopped by protective stop control.  |
|                     |                           | 24°C                | Displays the reason for the stop (stop code) 4 times previous when the air conditioner was stopped by protective stop control.  |
| Cooling             | LO                        | 25°C                | Displays the reason for the stop (stop code) 5 times previous when the air conditioner was stopped by protective stop control.  |
| Cooming             | LO                        | 26°C                | Displays the reason for the stop (stop code) 6 times previous when the air conditioner was stopped by protective stop control.  |
|                     |                           | 27°C                | Displays the reason for the stop (stop code) 7 times previous when the air conditioner was stopped by protective stop control.  |
|                     |                           | 28°C                | Displays the reason for the stop (stop code) 8 times previous when the air conditioner was stopped by protective stop control.  |
|                     |                           | 29°C                | Displays the reason for the stop (stop code) 9 times previous when the air conditioner was stopped by protective stop control.  |
|                     |                           | 30°C                | Displays the reason for the stop (stop code) 10 times previous when the air conditioner was stopped by protective stop control. |

### (c) Error code, stop code table (Assignment of error codes and stop codes is done in common for all models.)

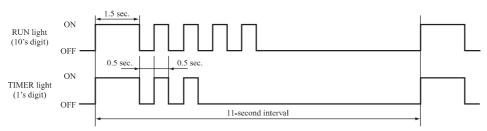

| Number of fla<br>service     |  |                               |   |   |  |                  |      |
|------------------------------|--|-------------------------------|---|---|--|------------------|------|
| RUN<br>light<br>(10's digit) | TIMER<br>light   | Stop coad<br>or<br>Error coad | Error content   | Cause   | Occurrence conditions  | Error<br>display | Auto |

|                              | 6 time<br>f <b>l</b> ash   | 86                            | Heating high pressure control   | Heating overload operation. Indoor unit fan speed drops. Indoor heat exchanger sensor is short circuit.   | When high pressure control operates during heating operation and the compressor stops.   | _                | 0    |

Note (1) The number of flashes when in the Service Mode do not include the 1.5 second period when the lights light up at first (starting signal). (See the example shown below.)

• In the case of current cut (example: stop code "42")

The RUN light (10's digit) flashes 4 times and the TIMER light (1's digit) flashes 2 times.

4 × 10+2 × 1=42 → From the table, read the instructions for error code 42, "current cut".

- (2) Error display: 
   Is not displayed. (automatic recovery only)
  - O Displayed.
  - If there is a ( ) displayed, the error display shows the number of times that an auto recovery occurred for the same reason has reached the number of times in ( ).
  - reached the number of times in ( ).

    If no ( ) is displayed, the error display shows that the trouble has occurred once.
- (3) Auto Recovery: Does not occur
  - Auto recovery occurs.

### (d) Remote controller information tables

### 1) Operation switching

| Display pattern when in service mode | Operation switching            |  |  |  |  |  |
|--------------------------------------|--------------------------------|--|--|--|--|--|
| RUN light (Operation switching)      | when there is an abnormal stop |  |  |  |  |  |
| 0                                    | AUTO                           |  |  |  |  |  |
| 1                                    | DRY                            |  |  |  |  |  |
| 2                                    | COOL                           |  |  |  |  |  |
| 3                                    | FAN                            |  |  |  |  |  |

 $Note \ (1) \quad In \ the \ case \ of \ indoor \ heat \ exchanger \ sensor \ 2, \ match \ from \ 26 \ to \ 30 \ the \ temperature \ setting \ of \ remote \ controller. \ (Refor \ to \ page \ 45)$ 

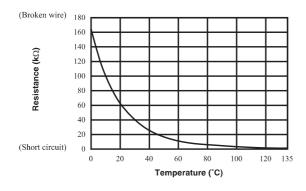

### (7) Inspection procedures corresponding to detail of trouble

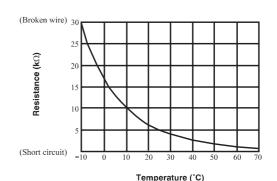

## Sensor error

Broken sensor wire, connector poor connection

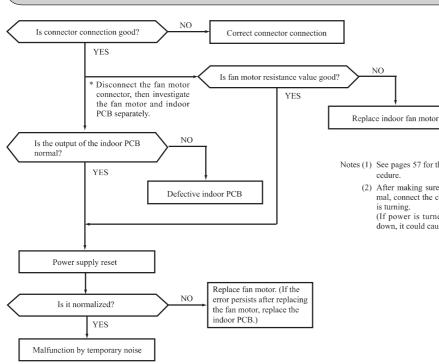

- ◆ Discharge pipe sensor temperature characteristics
- Sensor temperature characteristics (Room temp., indoor heat exchanger temp., outdoor heat exchanger temp., outdoor air temp,outdoor suction pipe temp.)

### Indoor fan motor error

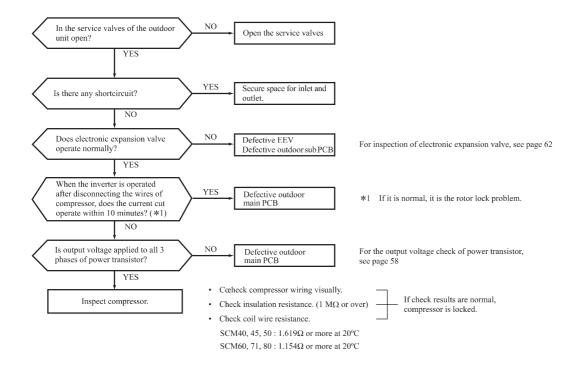

Defective fan motor, connector poor connection, defective indoor PCB

- Notes (1) See pages 57 for the fan motor and indoor PCB check procedure.
  - (2) After making sure the fan motor and indoor PCB are normal, connect the connectors and confirm that the fan motor is turning.
    - (If power is turned on while one or the other is broken down, it could cause the other to break down also.)

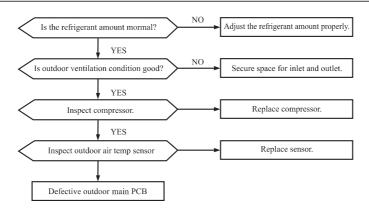

### **Current cut**

Compressor lock, Compressor wiring short circuit, Compressor output is open phase, Outdoor PCB is faulty, Service valve is closed, EEV is faulty, Compressor faulty.

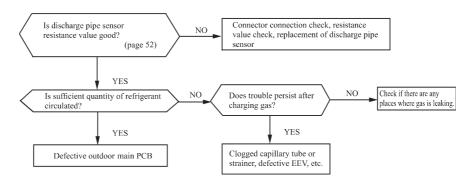

### **Current safe stop**

Overload operation, compressor lock, overcharge

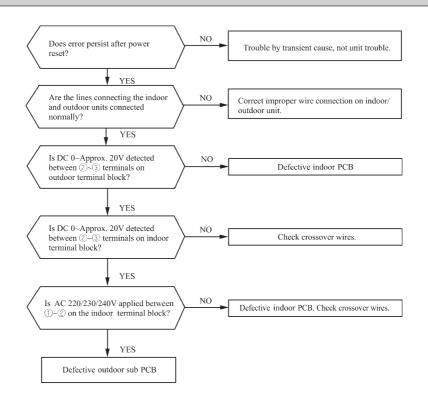

### Over heat of compressor

## Gas shortage, defective discharge pipe sensor

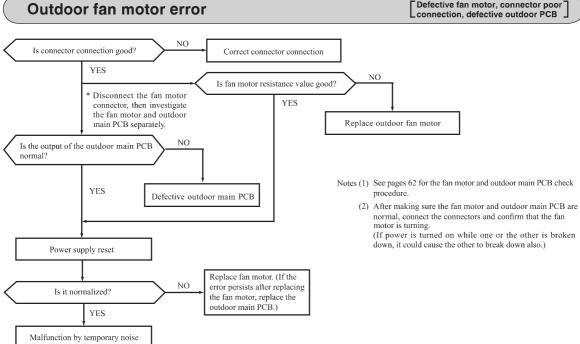

### **Error of signal transmission**

Wiring error including power cable, defective indoor/ outdoor PCB

#### Insufficient refregerant amount, Faulty power transistor, Broken compressor wire Service valve close, Defective EEV, Defective outdoor PCB Trouble of outdoor unit Is the power supply voltage OK? Check power supply. Proper power supply voltages are as follows. (At the power supply outlet) YES 220V:198~242V 230V: 207~253V Is the service valves of the outdoor 240V: 216~264V Open the service valves. unit open? YES Adjust the refrigerant Is the refrigerant amount normal? amount properly Does electronic expansion valve Defective EEV operate properly? or outdoor sub PCB. YES ◆ Judgment of refrigerant quantity Is the output voltage applied to all Defective outdoor (1) Phenomenon of insufficient refrigerant 3 phases of power transistor; main PCB. (a) Loss of capacity (b) Poor defrosting (Frost is not removed completely.) NO Is the connector for compressor (c) Longer time of hot keep Correct connection connection good? (5 minute or more) (Normal time: Approx. 1-1 minute and 30 seconds) Notes (1) For inspection of electronic expansion valve, see page 62 Is the checked result of insulation NO Defective outdoor (2) For the output voltage check of power transistor, see page 58 resistance and coil resistance of main PCB. compressor motor OK? (3) Check coil resistance, See pages 53. YES Replace compressor. Defective fan motor, connector poor connection, defective outdoor PCB Outdoor fan motor error

### Defective compressor, defective outdoor PCB **Rotor lock** Is output voltage applied to all 3 Defective outdoor main PCB phases of power transistor? YES • Check compressor wiring visually. If check results are normal, • Check insulation resistance. (1 $M\Omega$ or over) Inspect compressor. · Check coil wire resistance. See pages 53. [Drain piping defective,pump defect, float switch, indoor PCB] **Drain abnormality (SRR only)** NO NO Indoor PCB is defective. Has an overflow developed? Is the float switch operating? Is the drain piping clogged or at the wrong gradient? NO Inspect float switch. NO Is there output for drain motor driver: Repair and clean. YES Drain motor is defective. Inspect wiring. Indoor PCB is defective.

### (8) Phenomenon observed after shortcircuit, wire breakage on sensor

### (a) Indoor unit

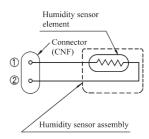

| Sensor                   | Operation | Phenomenon   |   |  |  |
|--------------------------|-----------|--|---|--|--|
| Sensor                   | mode      | Shortcircuit   | Disconnected wire   |  |  |
| Room temperature         | Cooling   | Release of continuous compressor operation command.      | Continuous compressor operation command is not released.                  |  |  |
| sensor                   | Heating   | Continuous compressor operation command is not released. | Release of continuous compressor operation command.                       |  |  |
| Heat exchanger<br>sensor | Cooling   | System can be operated normally.                         | Continiuous compressor operation command is not released. (Anti-frosting) |  |  |
|                          | Heating   | High pressure control mode (Compressor stop command)     | Hot keep (Indoor fan stop)  |  |  |
| Humidity sensor(1)       | Cooling   | Refer to the table below.                                | Refer to the table below.   |  |  |
|                          | Heating   | Normal system operation is possible.                     |   |  |  |

Note (1) SRK35, 50ZJ-S, 50, 60ZJX-S, SRF25, 35, 50ZJX-S only

### Humidity sensor operation

| Faile                | ure mode                   | Control input circuit resding | Air conditioning system operation      |  |
|----------------------|----------------------------|-------------------------------|--|--|
| cted                 | ① Disconnected wire        |                               |  |  |
| Disconnected<br>wire | ② Disconnected wire        | Humidity reading is 0%        | Anti-condensation control is not done. |  |
| Disc                 | ①② Disconnected wire       |                               |  |  |
| Short                | ① and ② are shot circuited | Humidity reading is 100%      | Anti-condensation control keep doing.  |  |

Remark: Do not perform a continuity check of the humidity sensor with a tester. If DC current is applied, it could damage the sensor.

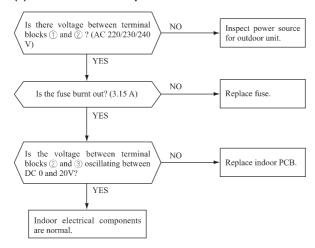

### (b) Outdoor unit

| Sensor                   | Operation | Phenomenon   |   |  |  |
|--------------------------|-----------|--|---|--|--|
| Sensor                   | mode      | Shortcircuit   | Disconnected wire   |  |  |
| Heat exchanger           | Cooling   | System can be operated normally.                               | Compressor stop.  |  |  |
| sensor                   | Heating   | Defrosting is not performed.                                   | Defrosting is performed for 10 minutes at approx. 40 minutes. |  |  |
| Ourdoor air              | Cooling   | System can be operated normally.                               | Compressor stop.  |  |  |
| temperature sensor       | Heating   | Defrosting is not operated.                                    | Defrosting is performed for 10 minutes at approx. 40 minutes. |  |  |
| Discharge pipe<br>sensor | All modes | Compressor overload protection is disabled. (Can be operated.) | Compressor stop   |  |  |

### (9) Checking the indoor electrical equipment

### (a) Indoor PCB check procedure

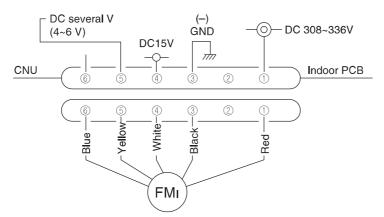

### (b) Indoor unit fan motor check procedure

This is a diagnostic procedure for determining if the indoor unit's fan motor or the indoor PCB is broken down.

### 1) Indoor PCB output check

- a) Turn off the power.
- b) Remove the front panel, then disconnect the fan motor lead wire connector.
- c) Turn on the power. If the unit operates when the ON/OFF button is pressed, if trouble is detected after the voltages in the following figure are output for approximately 30 seconds, it means that the indoor PCB is normal and the fan motor is broken down.

If the voltages in the following figure are not output at connector pins No.  $\bigcirc$ ,  $\bigcirc$  and  $\bigcirc$ , the indoor PCB has failed and the fan motor is normal.

| Measuring point | Resistance when normal |
|-----------------|------------------------|
| 1 - 3           | DC 308~336V            |
| 4-3             | DC 15V                 |
| 5-3             | DC several V (4~6V)    |
| 6-3             | DC several V (4~6V)    |

### 2) Fan motor resistance check

| Measuring point        | Resistance when normal          |
|------------------------|---------------------------------|
| 1) - (3) (Red - Black) | $20~\mathrm{M}\Omega$ or higher |
| 4 - 3 (White - Black)  | 20 kΩ or higher                 |

Notes (1) Remove the fan motor and measure it without power connected to it.

(2) If the measured value is below the value when the motor is normal, it means that the fan motor is faulty.

### (C) Power transistor inspection procedure

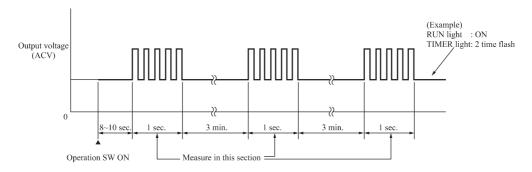

[Use a tester with a needle indicator for the inspection. (Do not use a digital tester. Check in the AC 300 volt range.)]

(1) If there is a self-diagnosis display, inspect the compressor system (burns, wiring mistakes, etc.) If no problems are found, check the output of the power transistor.

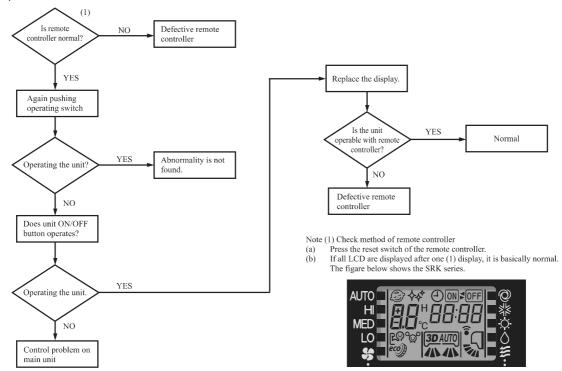

### (2) Output inspection procedure

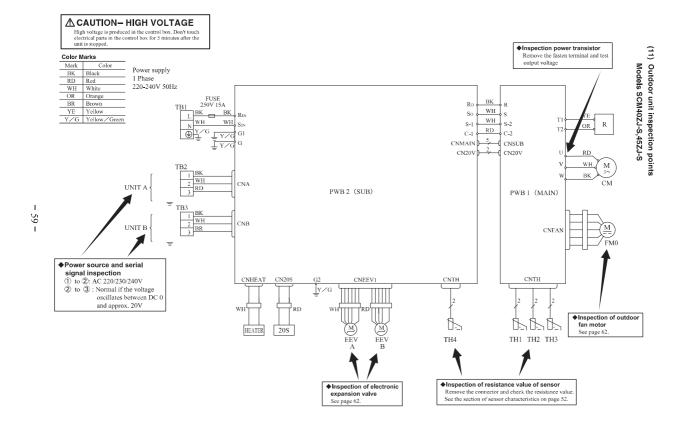

Disconnect the terminals for the compresseor.

If an output such as the one shown in the figure on the below can be measured, the power transistor and the circuit board for the outdoor unit are normal.

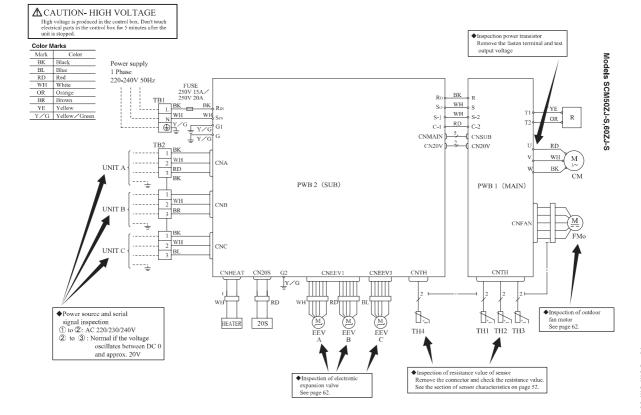

### (10) How to make sure of wireless remote controller

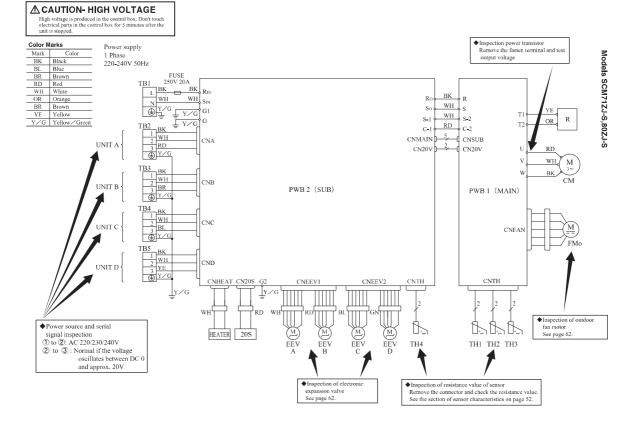

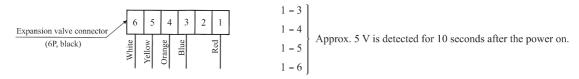

### (a) Inspection of electronic expansion valve

Electronic expansion valve operates for approx. 10 seconds after the power on, in order to determine its aperture. Check the operating sound and voltage during the period of time. (Voltage cannot be checked during operation in which only the aperture change occurs.)

- 1) If it is heard the sound of operating electronic expansion valve, it is almost normal.
- 2) If the operating sound is not heard, check the output voltage.

- 3) If voltage is detected, the outdoor sub PCB is normal.
- 4) If the expansion valve does not operate (no operating sound) while voltage is detected, the expansion valve is defective.

### • Inspection of electronic expansion valve as a separate unit

Measure the resistance between terminals with an analog tester.

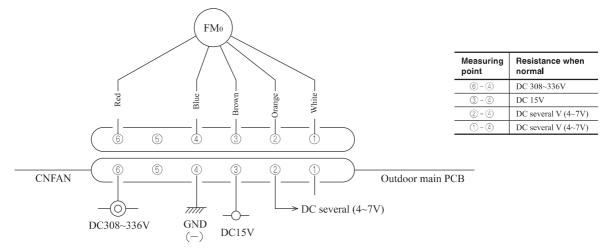

| Measuring point | Resistance when normal |
|-----------------|------------------------|
| 1-6             |                        |
| 1-4             | $46\pm4\Omega$         |
| 1-3             | (at 20°C)              |
| 1-5             |                        |

### (b) Outdoor unit fan motor check procedure

- · When the outdoor unit fan motor error is detected, diagnose which of the outdoor unit fan motor or outdoor main PCB is defective.
- Diagnose this only after confirming that the indoor unit is normal.
- (1) Outdoor main PCB output check
  - 1) Turn off the power.
  - 2) Disconnect the outdoor unit fan motor connector CNFAN.
  - 3) When the outdoor unit is operated by inserting the power supply plug and pressing (ON) the backup switch for more than 5 seconds, if the voltage of pin No. ② in the following figure is output for 30 seconds at 20 seconds after turning "ON" the backup switch, the outdoor main PCB is normal but the fan motor is defective.

If the voltage is not detected, the outdoor main PCB is defective but the fan motor is normal.

Note (1) The voltage is output 3 times repeatedly. If it is not detected, the indoor unit displays the error message.

### 2) Fan motor resistance check

| Measuring point       | Resistance when normal         |
|-----------------------|--------------------------------|
| 6 - 4 (Red - Black)   | $20 \text{ M}\Omega$ or higher |
| 3 - 4 (White - Black) | 20 kΩ or higher                |

Notes (1) Remove the fan motor and measure it without power connected to it.

(2) If the measured value is below the value when the motor is normal, it means that the fan motor is faulty.

### 2.2 FDTC series

### 2.2.1 Diagnosing of microcomputer circuit

### (1) Selfdiagnosis function

### (a) Check indicator table

Whether a failure exists or not on the indoor unit and outdoor unit can be know by the contents of remote controller error code, indoor/outdoor unit green LED (power pilot lamp and microcomputer normality pilot lamp) or red LED (check pilot lamp).

### (i) Indoor unit

Note (1) Normal indicator lamp (Indoor unit: Green) extinguishes (or lights continuously) only when CPU is anomalous. It keeps flashing in any trouble other than anomalous CPU.

<sup>(2) \*</sup> mark in the Description of trouble means that, in ordinary diagnosis, it cannot identify the cause definitely, and, if the trouble is repaired by replacing the part, it is judged consequently that the replaced part was defective.

### (ii) Outdoor unit

| E 60       |          | Stays OFF | Keeps<br>flashing | 7 times<br>flash    | Compressor   | Anomalous compressor rotor lock   | Replacement   | 115                |      |                 |   |                       |  |

Note (1) \* mark in the Description of trouble means that, in ordinary diagnosis, it cannot identify the cause definitely, and, if the trouble is repaired by replacing the part, it is judged consequently that the replaced part was defective.

### (iv) Display sequence of error codes or inspection indicator lamps

### ■ Occurrence of one kind of error

Displays are shown respectively according to errors.

### ■ Occurrence of plural kinds of error

| Section                         | Category of display  |
|---------------------------------|--|
| Error code on remote controller | • Displays the error of higher priority (When plural errors are persisting)                      |
| Red LED on indoor control PCB   | E 1 E 5 · · E 10 > E 35 > E 60   |
| Red LED on outdoor main PCB     | • Displays the present errors. (When a new error has occurred after the former error was reset.) |

### ■ Error detecting timing

| Section | Error description  | Error code | Error detecting timing  |  |
|---------|--|------------|---|--|
|         | Drain trouble (Float switch activated)   | E9         | Whenever float switch is activated after 30 second had past since power ON.   |  |
|         | Communication error at initial operation   | "您WAIT您"   | No communication between indoor and outdoor units is established at initial operation.  |  |
|         | Remote controller communication circuit error  | ΕI         | Communication between indoor unit and remote controller is interrupted for mote than 2 minutes continuously after initial communication was established.  |  |
| Indoor  | Communication error during operation   | E5         | Communication between indoor and outdoor units is interrupted for mote than 2 minutes continuously after initial communication was established.   |  |
|         | Excessive number of connected indoor units by controlling with one remote controller | E 10       | Whenever excessively connected indoor units is detected after power ON.   |  |
|         | Return air temperature thermistor anomaly  | EΠ         | -50°C or lower is detected for 5 seconds continuously within 60 minutes after initial detection of this anomalous temperature.  |  |
|         | Indoor heat exchanger temperature thermistor anomaly                                 | E6         | -50°C or lower is detected for 5 seconds continuously within 60 minutes after initial detection of this anomalous temperature. Or 70°C or higher is detected for 5 seconds continuously.                                      |  |
|         | Outdoor air temperature sensor anomaly   | E 38       | -55°C or lower is detected for 5 seconds continuously 3 times within 40 minutes after initial detection of this anomalous sensor. Or -55°C or higher is detected for 5 seconds continuously within 20 seconds after power ON. |  |
| Outdoor | Outdoor heat exchanger temperature sensor anomaly                                    | E37        | -55°C or lower is detected for 5 seconds continuously 3 times within 40 minutes after initial detection of this anomalous sensor. Or -55°C or lower is detected for 5 seconds continuously within 20 seconds after power ON.  |  |
|         | Discharge pipe temperature sensor anomaly  | E 39       | -25°C or lower is detected for 5 seconds continuously 3 times within 40 minutes after initial detection of this anomalous sensor.   |  |
|         | Suction pipe temperature sensor anomaly  | E53        | -55°C or lower is detected for 5 seconds continuously 3 times within 40 minutes after initial detection of this anomalous sensor. Or -55°C or higher is detected for 5 seconds continuously within 20 seconds after power ON. |  |

### ■ Error log and reset

| Error indicator               | Memorized error log                  | Reset  |  |
|-------------------------------|--------------------------------------|--|--|
| Remote controller display     | Higher priority error is memorized.  | • Stop the unit by pressing the ON/OFF                                     |  |
| Red LED on indoor control PCB | Not memorized.                       | switch of remote controller.  • If the unit has recovered from anomaly, it |  |
| Red LED on outdoor main PCB   | Memorizes a mode of higher priority. | can be operated.   |  |

### ■ Resetting the error log

- Resetting the memorized error log in the remote controller

  Holding down "CHECK" button, press "TIMER" button to reset the error log memorized in the remote controller.
- · Resetting the memorized error log

The remote controller transmits error log erase command to the indoor unit when "VENTI" button is pressed while holding down "CHECK" button.

Receiving the command, the indoor unit erase the log and answer the status of no error.

#### (2) Troubleshooting procedure

When any trouble has occurred, inspect as follows. Details of respective inspection method will be described on later pages.

### (3) Troubleshooting at the indoor unit

With the troubleshooting, find out any defective part by checking the voltage (AC, DC), resistance, etc. at respective connectors at around the indoor PCB, according to the inspection display or operation status of unit (the compressor does not run, fan does not run, the 4-way valve does not switch, etc.), and replace or repair in the unit of following part.

### (a) Replacement part related to indoor PCB's

Control PCB, power supply PCB, temperature thermistor (return air, indoor heat exchanger), remote controller switch and fuse

Note (1) With regard to parts of high voltage circuits and refrigeration cycle, judge it according to ordinary inspection methods.

### (b) Instruction of how to replace indoor control PCB

### SAFETY PRECAUTIONS Read the "SAFETY PRECAUTIONS" carefully first of all and then strictly follow it during the replacement in order to protect yourself. The precautionary items mentioned below are distinguished into two levels, WARNING and CAUTION. Both mentions the important items to protect your health and safety so strictly follow them by any means ⚠ WARNING ⚠ CAUTION Wrong installation would cause serious consequences such as injuries or death. Wrong installation might cause serious consequences depending on circumstances. After completing the replacement, do commissioning to confirm there are no anomaly WARNING Replacement should be performed by the specialist. If you replace the PCB by yourself, it may lead to serious trouble such as electric shock or fire. Replace the PCB correctly according to these instructions. Improper replacement may cause electric shock or fire. Shut off the power before electrical wiring work. Replacement during the applying the current would cause the electric shock, unit failure or improper running. It would cause the damage of connected equipment such as fan motor,etc. Fasten the wiring to the terminal securely, and hold the cable securely so as not to apply unexpected stress on the terminal Loose connections or hold could result in abnormal heat generation or fire. Check the connection of wiring to PCB correctly before turning on the power, after replacement. Defectiveness of replacement may cause electric shock or fire CAUTION In connecting connector onto the PCB, connect not to deform the PCB. It may cause breakage or malfunction. Insert connecter securely, and hook stopper. It may cause fire or improper running • Bundle the cables together so as not to be pinched or be tensioned. It may cause malfunction or electric shock for disconnection or deformation

### · Control PCB

Replace and set up the PCB according to this instruction.

### PSB012D931F 🛕

### ① Set to an appropriate address and function using switch on PCB.

Select the same setting with the removed PCB.

|   | item     | switch   | Content of control                                 |                                      |  |
|---|----------|----------|--|--------------------------------------|--|
|   | Address  | SW2      | Plural indoor units control by 1 remote controller |                                      |  |
| Г | Test run | un SW7-1 | _  | Normal                               |  |
|   | restruii |          | 0  | Operation check/drain motor test run |  |

O:ON -:OFF

### ② Set to an appropriate capacity using the model selector switch(SW6).

Select the same capacity with the PCB removed from the unit.

| SW6  | -1 | -2 | -3 | -4 |
|------|----|----|----|----|
| 25VD | 0  | _  | _  | _  |
| 35VD | _  | 0  | _  | _  |
| 50VD | 0  | _  | 0  | _  |
| 60VD | 0  | 0  | 0  | _  |

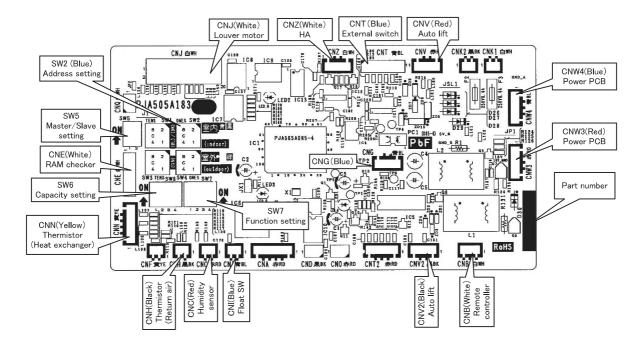

Example setting fro 25VD

### 3 Replace the PCB

- 1. Fix the PCB so as not to pitch the cords.
- 2. Connect connectors to the PCB. Connect a cable connector with the PCB connector of the same color.
- $3.\mbox{Do}$  not pass CPU surrounding about wirings.

### ④ Control PCB

Parts mounting are different by the kind of PCB.

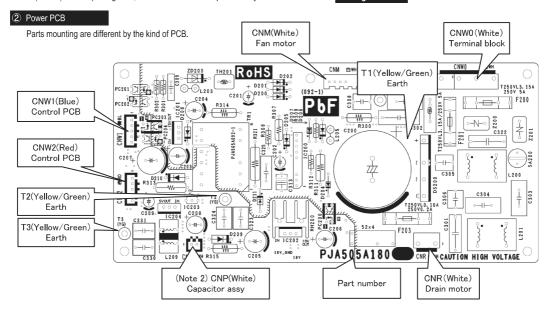

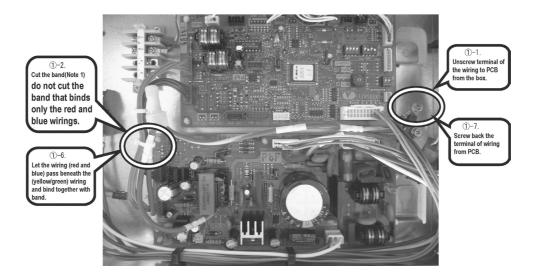

• Power PCB PSB012D953A

This PCB is a general PCB. Replace the PCB according to this instruction.

### ① Replace the PCB (refer to right dwg.)

- 1. Unscrew terminal of the wiring(yellow/green) soldered to PCB from the box.
- 2. Cut the band that binds the wiring (red and blue) from connector CNW1 and CNW2, and the wiring (yellow/green) from PCB (T2/T3) . (Note 1) (However, do not cut the band that binds only the red and blue wirings.)
- 3. Replace the PCB only after all the wirings connected to the connector are removed.
- 4. Fix the board such that it will not pinch any of the wires.
- 5. Reconnect the wirings to the PCB. Wiring connector color should match with the color of connector of the PCB. (Note 2)
- 6. Let the wiring (red and blue) pass beneath the (yellow/green) wiring and bind together with band.
- 7. Screw back the terminal of wiring (yellow/green) from PCB(T1, T2/T3), that was removed in 1. In that case, do not place the crimping part of the wiring under the PCB.
  - (Note 1): It might not be applicable on some models.
  - (Note 2): After replacing PCB, connection between capacitor assy and connector CNP is no longer needed.

### ●DIP switch setting list

| Switches | Description   |  | Default setting |        | Remarks     |
|----------|---|--|-----------------|--------|-------------|

# (4) Check of anomalous operation data with the remote controller

Operation data can be checked with remote control unit operation.

- ① Press the CHECK button.

  The display change "OPER DATA"

  ▼ "
- ② Press the ◯ (SET) button while "OPER DATA ▼" is displayed.
- When only one indoor unit is connected to remote controller, "DATA LOADING" is displayed (blinking indication during data loading).

Next, operation data of the indoor unit will be displayed. Skip to step ②.

- When plural indoor units is connected, the smallest address number of indoor unit among all connected indoor unit is displayed. [Example]:
  - " ⊕ \$ELECT I/U" (blinking 1 seconds) → " I/U000 
    blinking.
- Select the indoor unit number you would like to have data displayed with the button.
- © Determine the indoor unit number with the O (SET) button. (The indoor unit number changes from blinking indication to continuous indication)
  - "I/U000" (The address of selected indoor unit is blinking for 2 seconds.)

 $\downarrow$ 

"DATA LOADING" (A blinking indication appears while data loaded.)
Next, the operation data of the indoor unit is indicated.

② Upon operation of the 

▲ 

▼ button, the current operation data is displayed in order from data number 01.

The items displayed are in the above table.

- \*Depending on models, the items that do not have corresponding data are not displayed.
- ® To display the data of a different indoor unit, press the AIR CON NO. button, which allows you to go back to the indoor unit selection screen.
- Pressing the OON/OFF button will stop displaying data.

  Pressing the (RESET) button during remote control unit operation will undo your last operation and allow you to go back to
  the previous career.

⊙If two (2) remote controllers are connected to one (1) inside unit, only the master controller is available for trial operation and confirmation of operation data. (The slave remote controller is not available.)

### (5) Inverter checker for diagnosis of inverter output

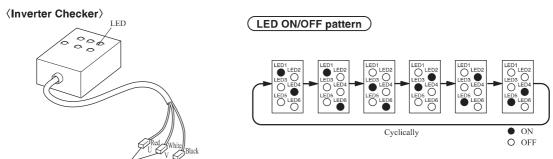

### Checking method

- (a) Setup procedure of checker.
  - 1) Power OFF (Turn off the breaker).
  - 2) Remove the terminal cover of compressor and disconnect the wires (U, V, W) from compressor.
  - 3) Connect the wires U (Red), V (White) and W (Black) of the checker to the terminal of disconnected wires (U, V, W) from compressor respectively.
- (b) Operation for judgment.
  - 1) Power ON and start check operation on cooling or heating mode.
  - 2) Check ON/OFF status of 6 LED's on the checker.
  - 3) Judge the PCB by ON/OFF status of 6 LED's on the checker.

| _    | N/OFF<br>is of LED | If all of LED are ON/OFF according to following pattern | If all of LED stay OFF or some of LED are ON/OFF |
|------|--------------------|---|--|
| Outo | door main<br>PCB   | Normal  | Anomalous  |

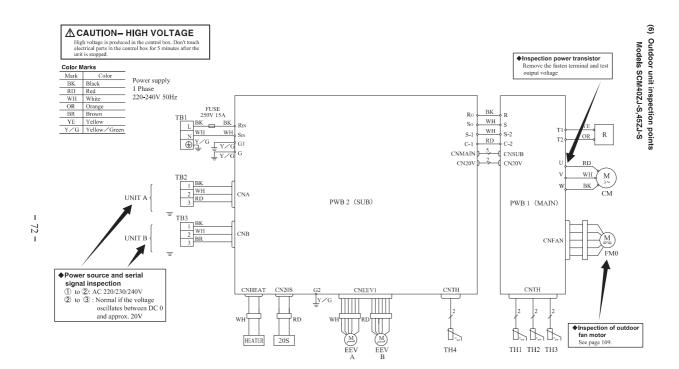

4) Stop check operation within about 2minutes after starting check operation.

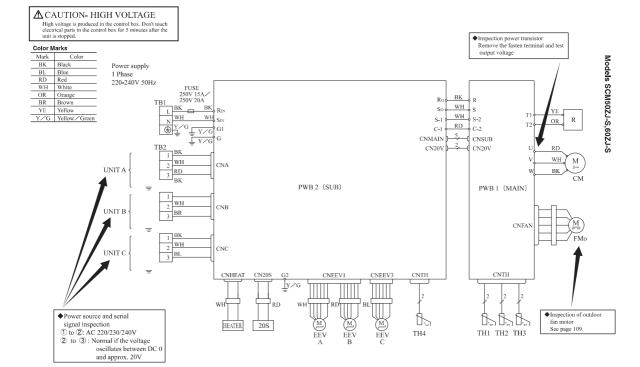

Faston terminal of the wires which are disconnected from compressor.

All models

#### 2. Error detection method

Anomalously low temperature or high temperature (resistance) is detected by indoor return air temperature thermistor (ThI-A)

#### 3. Condition of Error displayed

• When the temperature thermistor detects -50°C or lower for 5 seconds continuously, the compressor stops. After 3-minute delay, the compressor starts again automatically, but if this error occurs again within 60 minutes after the initial detection.

#### 4. Presumable cause

- Defective return air temperature thermistor connector
- Defective return air temperature thermistor
- Faulty indoor control PCB

#### 5. Troubleshooting Diagnosis Countermeasure Is the connection of return air temperature thermisto connector OK? Correct. → Connect connector. YES Are the characteristics of return a temperature thermistor OK? Defective return air temperature thermistor $\rightarrow$ Replace. Defective indoor control YES PCB → Replace. (Defective return air temperature thermistor input circuit) Temperature-resistance characteristic (Broken wire) Temperature thermistor resistance (kΩ) 5kΩ at 25°C (Shot circuit) 0 10 20 30 40 Temperature (°C)

#### 2. Error detection method

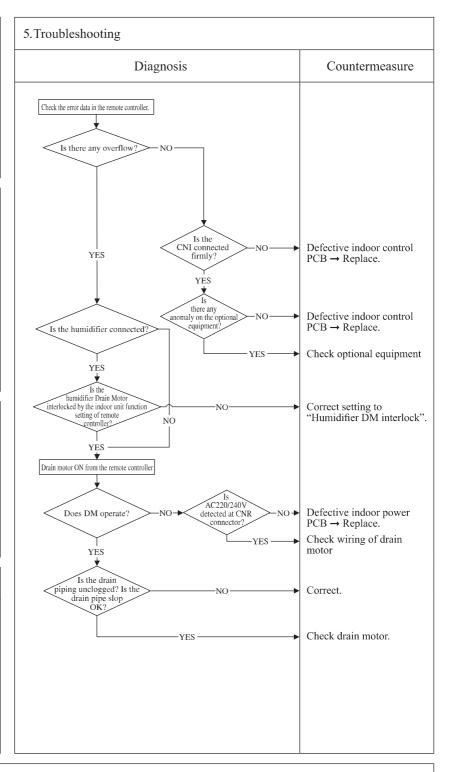

Float switch is activated

#### 3. Condition of Error displayed

If the float switch OPEN is detected for 3 seconds continuously or if float switch connector or wire is disconnected.

#### 4. Presumable cause

- Defective indoor control or power PCB
   Float switch setting error
   Humidifier DM interlock
- setting error
- Optional equipment setting error
- Drain piping error
- Defective drain motor
- Disconnection of drain motor wiring

Note: When this error occurred at power ON, disconnection of wire or connector of the float switch is suspected. Check and correct it (or replace it, if necessary).

|   |                        | Outdoor | _              | Keeps flashing | Outdoor fair motor anomary |

# 1. Applicable model

All models

#### 2. Error detection method

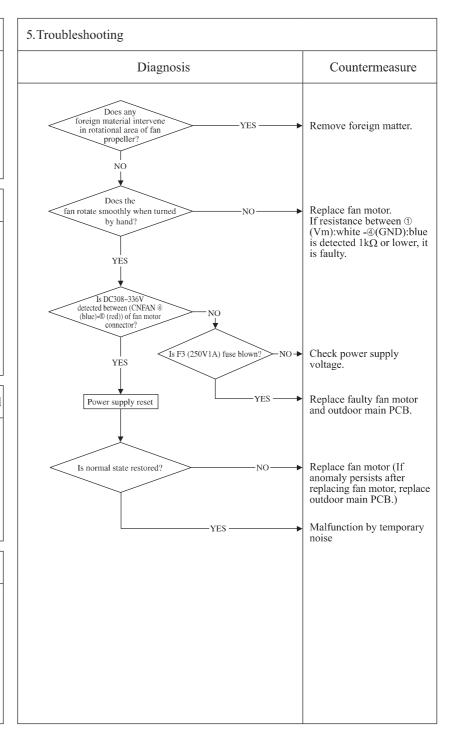

Detected by rotation speed of outdoor fan motor

#### 3. Condition of Error displayed

When actual rotation speed of outdoor fan motor drops to 75min<sup>-1</sup> or lower for 30 minutes continuously, the compressor and the outdoor fan motor stop. After 3-minutes delay, it starts again automatically, but if this anomaly occurs 3 times within 60 minutes after the initial detection.

#### 4. Presumable cause

- Defective outdoor main PCB
- Foreign material at rotational area of fan propeller
- Defective fan motor
- Dust on outdoor main PCB Blown F3 fuse

Note: When E48 error occurs, in almost cases F3 fuse (1A) on the outdoor main PCB is blown. There are a lot of cases that fuse is blown and E48 occurs due to defective fan motor. And even though only the outdoor main PCB ( or fuse) is replaced,, another trouble could occur. Therefore when fuse is blown, check whether the fan motor is OK or not.

After confirming the fan motor normal, check by power ON. (Don't power ON without confirming the fan motor normal.)

#### 5. APPLICATION DATAS

#### 5.1 Installation of outdoor unit

(1) Models SCM40ZJ-S, 45ZJ-S

RPC012A915

MULTI TYPE AIR CONDITIONER R410A REFRIGERANT USED

- This installation manual deals with outdoor units and general installation specifications only. For indoor units, refer to page 139 and 160.
  When install the unit, be sure to check whether the selection of installation place, power supply specifications, usage limitation (piping length, height differences between indoor and outdoor units, power supply voltage and etc.) and installation spaces.

#### **SAFETY PRECAUTIONS**

**⚠ WARNING** 

cause burst and refrigerant leakage after a long period.

Do not open the operation valves for liquid line and

gas line until completed refrigerant piping work, air

rugnmess test and evacuation.

If the compressor is operated in state of opening operation valves before completed connection of refrigerant piping work, air can be sucked into refrigerant circuit, which can cause bust or personal injury due to anomalously high pressure in the refrigerant.

The electrical installation must be carried out by the rine electrical installation must be carried out by the qualified electrician in accordance with "the norm for electrical work" and "national wiring regulation", and the system must be connected to the dedicated

Power supply with insufficient capacity and incorrect function done by improper work can cause electric shocks

Be sure to shut off the power before starting electrical

Failure to shut off the power can cause electric shocks, unit

nformable cables can cause electric leak, anomalous

Be sure to use the cables conformed to safety standard and cable ampacity for power distribution

tightness test and evacuation.

- We recommend you to read this "SAFETY PRECAUTIONS" carefully before the installation work in order to gain full advantage of the functions of the unit and to avoid malfunction due to
- The precautions described below are divided into **WARNING** and **CAUTION**. The matters with possibilities leading to serious consequences such as death or serious personal injury due to erroneous handling are listed in the \( \int \) WARNING and the matters with possibilities leading to personal injury or damage of the unit due to erroneous handling including probability leading to serious consequences in some cases are listed in \( \int \) CAUTION. These
- are very important precautions for safety. Be sure to observe all of them without fail.
   Be sure to confirm no anomaly on the equipment by commissioning after completed installation and explain the operating methods as well as the maintenance methods of this equipment to
- the user according to the owner's manual.
- Keep the installation manual together with owner's manual at a place where any user can read at any time. Moreover if necessary, ask to hand them to a new user.

  For installing qualified personnel, take precautions in respect to themselves by using suitable.
- protective clothing, groves, etc., and then perform the installation works.

  Please pay attention not to fall down the tools, etc. when installing the unit at the high position.

  If unusual noise can be heard during operation, consult the dealer.
- . Symbols which appear frequently in the text have the following meaning:

Provide proper earthing

#### • Installation must be carried out by the qualified Tighten the flare nut by torque wrench with specified

installer.
If you install the system by yourself, it may cause serious trouble such as water leaks, electric shocks, fire and personal injury, as a result of a system malfunction.

Install the system in full accordance with the instruction manual. Incorrect installation may cause bursts, personal injury, water leaks, electric shocks and fire.

- water leaks, electric shocks and fire.

  \*Be sure to use only for household and residence.

  If this appliance is installed in inferior environment such as machine shop and etc., it can cause malfunction.

  \*Use the original accessories and the specified components for installation.

  If parts other than those prescribed by us are used, It may cause water leaks, electric shocks, fire and personal injury.

  Install the unit in a location with good support.

  Unsuitable installation locations can cause the unit to fall conductors are prescribed by the conductors of the conductors.
- Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury.

   Ensure the unit is stable when installed, so that it can
- withstand earthquakes and strong winds.
  Unsuitable installation locations can cause the unit to fall
- and cause material damage and personal injur Ventilate the working area well in the event of refrigerant leakage during installation.
   If the refrigerant comes into contact with naked flames, oisonous das is produced
- Use the prescribed pipes, flare nuts and tools for

Ose the prescribed pipes, liare huts and tools for R410A. Using existing parts (for R22 or R407C) can cause the unit failure and serious accidents due to burst of the refrigerant circuit. . Ensure that no air enters in the refrigerant circuit

This appliance must be connected to main power supply by means of a circuit breaker or switch (fuse:25A) with a contact separation of at least 3mm. Do not bundling, winding or processing for the power cord. Or, do not deforming the power plug due to

failure or incorrect function of equipment.

production or fi

Use the prescribed cables for electrical connection, tighten the cables securely in terminal block and relieve the cables correctly to prevent overloading the terminal blocks. If the flare nut were tightened with excess torque, this may

Loose connections or cable mountings can cause anomalous heat production or fire.

- Arrange the wiring in the control box so that it cannot ished up further into the box. Install the servi panel correctly.
  Incorrect installation may result in overheating and fire.
- Incorrect installation may result in overheating and lire.

  Be sure to fix up the service panels.
  Incorrect fixing can cause electric shocks or fire due to intrusion of dust or water.

  Be sure to switch off the power supply in the event of installation, inspection or servicing.
  If the power supply is not shut off, there is a risk of electric shocks, unit failure or personal injury due to the unexpected start of fan.
- Stop the compressor before discor ecting refrigerant pipes in case of pump down operation. If disconnecting refrigerant pipes in state of opening operation valves before compressor stopping, air can be sucked, which can cause burst or personal injury due to
- anomalously high pressure in the refrigerant circui Only use prescribed optional parts. The installation must be carried out by the qualified installer. If you install the system by yourself, it can cause serious trouble such as water leaks, electric shocks, fire.

when the unit is insta∎ed and removed.

If air enters in the refrigerant circuit, the pressure in the refrigerant circuit becomes too high, which can cause burst and personal injury

Do not processing, splice the power cord, or share a socket with other power plugs. This may cause fire or electric shock due to defecting contact, defecting insulation and over-current etc.

tread it.

tread it.
This may cause fire or heating.
• Do not run the unit with removed panels or

protections.
Touching rotating equipments, hot surfaces or high voltage parts can cause personal injury due to entrapment, burn or electric shocks.

. Do not perform any change of protective device itself

or its setup condition.

The forced operation by short-circuiting protective device of pressure switch and temperature controller or the use of non specified component can cause fire or burst.

0

· Carry out the electrical work for ground lead with care.

Do not connect the ground lead to the gas line, water line, lightning conductor or telephone line's ground lead. Incorrect grounding can cause unit faults such as electric shocks due to short-circuiting. **⚠** CAUTION

#### Use the circuit breaker with sufficient breaking capacity capacity. If the breaker does not have sufficient breaking capacity, it

can cause the unit malfunction and fire.

Earth leakage breaker must be installed.

If the earth leakage breaker is not installed, it can cause lectric shocks Install isolator or disconnect switch on the power supply wiring in accordance with the local codes and

- regulations.

   After maintenance, all wiring, wiring ties and the like, should be returned to their original state and wiring route, and the necessary clearance from all metal parts should be secured.

   Secure a space for installation, inspection and maintenance specified in the manual. Insufficient space can result in accident such as personal injury due to falling from the installation place.

Take care when carrying the unit by hand.

If the unit weights more than 20kg, it must be carried by two or more persons. Do not carry by the plastic straps, always use the carry handle when carrying the unit by hand. Use gloves to minimize the risk of cuts by the aluminum fins.

Dispose of any packing materials correctly.

Any remaining packing materials care quises personal injury.

Any remaining packing materials can cause personal injury as it contains nails and wood. And to avoid danger of suffocation, be sure to keep the plastic wrapper away from children and to dispose after tear it up.

children and to dispose after fear it up.

Be sure to insulate the refrigerant pipes so as not to
condense the ambient air moisture on them.
Insufficient insulation can cause condensation, which can
lead to moisture damage on the ceiling, floor, furniture and
any other valuables.

When perform the air conditioner operation (cooling or drying operation) in which ventilator is installed in the room. In this case, using the air conditioner in parallel with the ventilator, there is the possibility that drain water may backflow in accordance with the room lapse into the negative pressure status. Therefore, set up the opening port such as incorporate the air into the room that may appropriate to ventilation (For example; Open the door a little). In addition, just as above, so set up the opening port if the room lapse into negative pressure status due to register of the wind for the high rise apartment etc.

# • Do not install the unit in the locations listed below.

- Locations where carbon fiber, metal powder or any powder is floating.

  Locations where any substances that can affect the unit
- such as sulphide gas, chloride gas, acid and alkaline can
- occur.

   Vehicles and ships.
   Locations where cosmetic or special sprays are often
- useo.

  Locations with direct exposure of oil mist and steam such as kitchen and machine plant.

  Locations where any machines which generate high frequency harmonics are used.

  Locations with saliy almospheres such as coastlines.

  Locations with heavy snow (If installed, be sure to provide

- base flame and snow hood mentioned in the manual).
- Locations where the unit is exposed to chimney smoke
   Locations at high altitude (more than 1000m high)
- Locations where heat radiation from other heat source can

- Locations where heat radiation from other heat source car affect the unit.

  Locations without good air circulation.

  Locations with any obstacles which can prevent inlet and outlet air of the unit.

  Locations where short circuit of air can occur (in case of multiple units installation).

  Locations where strong air blows against the air outlet of outdoor unit.

  Lan cause remarkable decrease in performance, corrosion.
- It can cause remarkable decrease in performance, corrosion and damage of components, malfunction and fire.

#### . Do not install the outdoor unit in the locations listed

- Locations where discharged hot air or operating sound of
- the outdoor unit can bother neighborhood.

  Locations where outlet air of the outdoor unit blows

- Locations where outlet air of the outdoor unit blows directly to plants.

  Locations where vibration can be amplified and transmitted due to insufficient strength of structure.

  Locations where vibration and operation sound generated by the outdoor unit can affect seriously (on the wall or at the place near bed room).

  Locations where an equipment affected by high harmonics is placed (IV set or radio receiver is placed within 1m).

  Locations where drainage cannot run off safely.

  It can affect surrounding environment and cause a claim.

- Do not install the unit near the location where leakage of combustible gases can occur.
   If leaked gases accumulate around the unit, it can cause
- Do not install the unit where corrosive gas (such as sulfurous acid gas etc.) or combustible gas (such as thinner and petroleum gases) can accumulate or collect, or where volatile combustible substances are handled.

Corrosive gas can cause corrosion of heat exchanger breakage of plastic parts and etc. And combustible gas can

Do not install nor use the system close to the equipment that generates electromagnetic fields or

equipment that generates electromagnetic fields of high frequency harmonics. Equipment such as inverters, standby generators, medical high frequency equipments and telecommunication equipments can affect the system, and cause malfunctions

#### **⚠** CAUTION

and breakdowns. The system can also affect medical equipment and telecommunication equipment, and obstruct ion or cause jamming.

Do not install the outdoor unit in a location where insects and small animals can inhabit. Insects and small animals can enter the electric parts and cause damage or fire. Instruct the user to keep the

surroundings clean. Do not use the base flame for outdoor unit which is corroded or damaged due to long periods of

operation. ing an old and damage base flame can cause the unit

falling down and cause personal injury.

• Do not use any materials other than a fuse with the correct rating in the location where fuses are to be

correct rains in a course was declared and a connecting the circuit with copper wire or other metal thread can cause unit failure and fire.

- Do not touch any buttons with wet hands.
- Do not touch any refrigerant pipes with your hands

when the system is in operation.

During operation the refrigerant pipes become extremely hot or extremely cold depending the operating condition, and it

- can cause burn injury or frost injury.

   Do not touch the suction or aluminum fin on the outdoor unit.
- Do not put anything on the outdoor unit and operating

This may cause damage the objects or injury due to falling to the object.

#### Check before installation work

#### SELECTION OF INSTALLATION LOCATION

#### Install at location that meets the following conditions after getting approval from the customer.

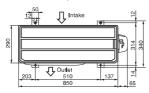

- Where the following installation space is available, and where air does not gather.
- Where rain and sunlight do not directly hit the unit, and where there is enough air circulation.
- Also, where the unit cannot be buried by snow. a location which can sustain the weight of the unit, and where noises and vibrations are not enhanced
- Where blasts of cold or hot air and noise do not bother the neighbors.
- Where the unit does not receive heat radiation from other heat sources.
  Where there are no obstructions (animals, plants, etc.) to the suction inlet and blowing outlet.
- Where water may drain out.
- ※ Please avoid the following locations.
- Where there is constant exposure to harsh winds such as the top floors of a building. Also, locations with exposure to salty air.
- Where there are oil splashes, vapor, and smoke.
  Where there are possibilities of flammable gas leaks.

- 1) Installation Space (on a flat surface)
  - OBlowing out port and suction port on the back side of the unit can be installed at a distance of 10cm from walls.
    - In case the barrier is 1.2m or above in height, or is overhead, the sufficient space between the unit and wall shall be secured.
  - When the unit is installed, the space of the following dimension and above shall be secured.

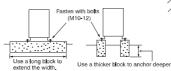

#### Installation

1 Anchor bolt fixed position

② Notabilia for installation

- In installing the unit, fix the unit's legs with bolts specified on the left.
- The protrusion of an anchor bolt on the front side must be kept within 15 mm.
- Securely install the unit so that it does not fall over during earthquakes or strong winds, etc.
- Refer to the above illustrations for information regarding concrete foundations.
- Install the unit in a level area. (With a gradient of 5 mm or less.)

Improper installation can result in a compressor failure, broken piping within the unit and abnormal noise generation.

# **INSTALLATION OF OUTDOOR UNIT** Drainage

- There are 2 holes in the bottom panel of the outdoor unit to drain condensation.
- Install the outdoor unit so it will be horizontal.
   Also, secure the legs of the unit to a firm foundation to prevent any instabilities.
- Secure it firmly so the unit will not fall during earthquakes and from sudden gusts of wind.
- In areas where the temperatures drop below 0°C for several continuous days, do not install a drain elbow, (water discharge could stop due to freezing.)

Connection of the power supply cable and the connecting cables for indoor and outdoor units.

- This multi-type room air conditioner receives its power from outside.
   To ensure correct connections, mark each ends of the cables with number, A and B.
   It is important to use the same number the corresponding cables and pipes.
- An earth leakage breaker and a circuit breaker must be installed.
   Their capacities are 25A.

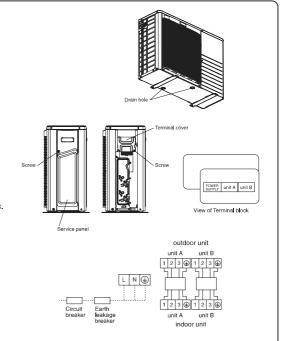

- ①Remove the service panel. (Remove the screw of the service panel.)
  ②Remove the terminal cover. (Remove the screw of the terminal cover.)
  ③Connect the power supply cable and the connection wire securely to the terminal block.

(POWER SUPPLY CODE)

CENELEC code for cables requiring fields cables. H05RNR3G4.0 (INTERCONNECTING WIRING CODE)

CENELEC code for cables requiring fields cables. H05RNR4G1.5

- In wiring, make sure that the wire terminal numbers of outdoor unit terminal block are match to the wire terminal numbers of indoor unit terminal block.
   Terminal number A of the outdoor unit is used for A indoor unit and terminal
- number B for B indoor unit respectively.
- 4 After connecting the wire, use wiring clamps to secure the wiring.
- 5Fit the terminal cover and the service panel.

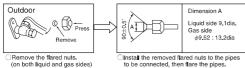

#### 3 CONNECTION OF REFRIGERANT PIPINGS

NOTE

- Cover the pipes with tape so that dust and sand do not enter the pipe until they are connected
- When connecting the pipes to the outdoor unit, be careful about the discharge of fluorocarbon gas or oil.

  Make sure to match the pipes between the indoor unit and the outdoor unit with the
- correct operation valves

Remove the flared nuts. (on both liquid and gas sides)

# **⚠** CAUTION

**⚠** CAUTION Do not apply excess torque to the flared nuts. Otherwise, the flared nuts may crack depending on the conditions and refrigerant leak may occur.

Do not apply refrigerating machine oil to the flared surface.

|                         | Measure                    | ement B (mm) |                      |
|-------------------------|----------------------------|--------------|----------------------|
| Copper pipe<br>diameter | Clutch typr flare tool for | Conventior   | nal (R22) flare tool |
| ulameter                | R410A                      | Clutch type  | Wing nut type        |
| $\phi$ 6.35             | 0.0~0.5                    | 1.0~1.5      | 1.5~2.0              |
| $\phi$ 9.52             | 0.0~0.5                    | 1.0~1.5      | 1.5~2.0              |

Use a flare tool designed for R410A or a conventional flare tool. Please note that measurement B (protrusion from the flaring block) will vary depending on the type of a measurement B (protrusion from the flaring plous) will vary depending on the type I flare tool in use.

If a conventional flare tool is used, please use copper pipe gauge or a similar instrument to check protrusion so that you can keep measurement B to a correct value.

#### Connection

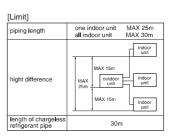

Outdoor

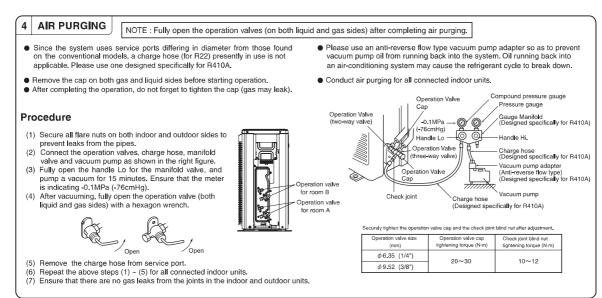

Connect the pipes on both liquid and gas sides Tighten the nuts to the following torque. Liquid side : 14.0~18.0N·m (1.4~1.8kgf·m) Gas side (\$\phi\$9.52): 33.0~42.0N·m (3.3~4.2kgf·m)

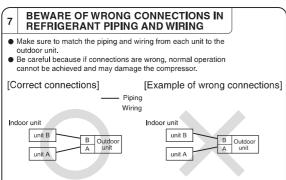

#### Gas Leakage Test

•Ensure that there are no gas leaks from the pipe joints by using a leak detector or soap water

#### 

#### **EARTHING WORK**

- Earth work shall be carried out without fail in order to prevent electric shock and noise generation.
- The connection of the earth cable to the following substances causes dangerous failures, therefore it shall never be done. (City water pipe, Town gas pipe, TV antenna, lightning conductor, telephoneline, etc.)

#### 6 TEST RUN AND HANDLING INSTRUCTIONS

# Installation test check points Check the following points again after completion of the installation, and before turning on the power. Conduct a test run again and ensure that the unit operates properly. At the same time, explain to the customer how to use the unit and how to take care of the unit following the installation manual. If the compressor does not operate after the operation has started, wait for 5-10 minutes. (This may be due to delayed start.) (Three-minutes restart preventive timer) When the air conditioner is restarted or when changing the operation, the unit will not start operating for approximately 3minutes. This is to protect the unit and it is not a malfunction. After installation The power supply voltage is correct as the rating. No gas leaks from the joints of the operation valve. Power cables and crossover wires are securely fixed to the terminal board. Each indoor and outdoor unit is properly connected (no wrong wiring or piping). Operation valve is fully open. Refrigerant has been additionally charged (when the total pipe length exceeds the refrigerant charged pipe length). The pipe joints for indoor and outdoor pipes have been insulated. Earthing work has been conducted properly. Test run Air conditioning and heating are normal. No abnormal noise. Water drains smoothly. Protective functions are not working. Operation of the unit has been explained to the customer. The remote control is normal.

#### Operation of indicator lamps

| INDICATION LAMP                       | COLOR FUNCTION                              |              |  |

#### (2) Models SCM50ZJ-S, 60ZJ-S

RPC012A916A

MULTI TYPE AIR CONDITIONER R410A REFRIGERANT USED

- This installation manual deals with outdoor units and general installation specifications only. For indoor units, refer to page 139 and 160.
- When install the unit, be sure to check whether the selection of installation place, power supply specifications, usage imitation (piping length, height differences between or and outdoor units, power supply voltage and etc.) and installation space

#### **SAFETY PRECAUTIONS**

**⚠** WARNING

Tighten the flare nut by torque wrench with specified

If the flare nut were tightened with excess torque, this may cause burst and refrigerant leakage after a long period.

• Do not open the operation valves for liquid line and gas line until completed refrigerant piping work, air tightness test and evacuation.

tightness test and evacuation.

If the compressor is operated in state of opening operation valves before completed connection of refrigerant piping work, air can be sucked into refrigerant circuit, which can cause bust or personal injury due to anomalously high pressure in the refrigerant.

The electrical installation must be carried out by the qualified electrician in accordance with "the norm for electrical work" and "national wiring regulation", and the system must be connected to the dedication.

the system must be connected to the dedicated

Power supply with insufficient capacity and incorrect

function done by improper work can cause electric shocks

Be sure to shut off the power before starting electrical Work.
Failure to shut off the power can cause electric shocks, unit failure or incorrect function of equipment.
Be ours to use the cables conformed to safety standard and cable ampacity for power distribution work. Unconformable cables can cause electric leak, anomalous heat production or fire.

This appliance must be connected to main power

- We recommend you to read this "SAFETY PRECAUTIONS" carefully before the installation work in order to gain full advantage of the functions of the unit and to avoid malfunction due to
- The precautions described below are divided into **WARNING** and **ACAUTION**. The matters with possibilities leading to serious consequences such as death or serious personal injury due to erroneous handling are listed in the **AWARNING** and the matters with possibilities leading to personal injury or damage of the unit due to erroneous handling including including including to personal injury or damage of the unit due to erroneous handling including including including to personal injury or damage of the unit due to erroneous handling including including including to personal injury or damage of the unit due to erroneous handling including including including the unit due to erroneous handling probability leading to serious consequences in some cases are listed in [ACAUTION]. These are very important precautions for safety. Be sure to observe all of them without fail.

  Be sure to confirm no anomaly on the equipment by commissioning after completed installation
- and explain the operating methods as well as the maintenance methods of this equipment to
- the user according to the owner's manual.
- Keep the installation manual together with owner's manual at a place where any user can read at any time. Moreover if necessary, ask to hand them to a new user.
- For installing qualified personnel, take precautions in respect to themselves by using suitable

- . Symbols which appear frequenty in the text have the following meaning

Strictly prohibited

Use the prescribed cables for electrical connection, tighten the cables securely in terminal block and relieve the cables correctly to prevent overloading the terminal blocks.

Loose connections or cable mountings can cause anomalous heat production or fire.

Arrange the wiring in the control box so that it cannot be pushed up further into the box. Install the service panel correctly.

Incorrect installation may result in overheating and fire.

Be sure to fix up the service panels.

Incorrect fixing can cause electric shocks or fire due to intrusion of dust or water.

Be sure to switch off the power supply in the event of installation, inspection or servicing.

If the power supply is not shut off, there is a risk of electric shocks, unit failure or personal injury due to the unexpected

Stop the compressor before disconnecting refrigerant

Stop the compressor before disconnecting refriger pipes in case of pump down operation. If disconnecting refrigerant pipes in state of opening operation valves before compressor stopping, air can be sucked, which can cause burst or personal injury due to anomalously high pressure in the refrigerant circuit. Only use prescribed optional parts. The installation must be carried out by the qualified installer. If you install the system by yourself, it can cause serious trouble such as water leaks, electric shocks, fire.

Loose connections or cable mountings can cause

Provide proper earthing

# 0

# Installation must be carried out by the qualified

Installer.

If you install the system by yourself, it may cause serious trouble such as water leaks, electric shocks, fire and

- personal Injury, as a result of a system malfunction.

  Install the system in full accordance with the Instruction manual.
- Instruction manual.
  Incorrect installation may cause bursts, personal injury,
  water leaks, electric shocks and fire.

  8 es ure to use only for household and residence.
  If this appliance is installed in inferior environment such as
  machine shop and etc., it can cause malfunction.

  Use the original accessories and the specified
  components for installation.
  If paris other than those prescribed by us are used, it may
- components for installation.
  If parts other than those prescribed by us are used, it may cause water leaks, electric shocks, fire and personal injury.
  Install the unit in a location with good support.
- Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury
- Ensure the unit is stable when installed, so that it can
- Ensure the unit is stable when installed, so that it co withstand earthquakes and strong winds. Unsultable installation locations can cause the unit to fall and cause material damage and personal injury. Ventilate the working area well in the event of refrigerant lockage during installation. If the refrigerant comes into contact with naked flames, poisonous gas is produced. Use the prescribed pipes, flare nuts and tools for R410A

Using existing parts (for R22 or R407C) can cause the unit failure and serious accidents due to burst of the refrigerant circuit

Do not bundling, winding or processing for the pov cord. Or, do not deforming the power plug due to

supply by means of a circuit breaker or switch

This may cause fire or heating.

• Do not run the unit with removed pane

electric shocks.

protections.
Touching rotating equipments, hot surfaces or high voltage parts can cause personal injury due to entrapment, burn of

(fuse:25A) with a contact separation of at least 3mm

Do not perform any change of protective device itself or its setup condition. The forced operation by short-circuiting protective device of

pressure switch and temperature controller or the use of non specified component can cause fire or burst.

Ensure that no air enters in the refrigerant circuit when the unit is installed and removed.
If air enters in the refrigerant circuit, the pressure in the refrigerant circuit becomes too high, which can cause burst

and personal injury. Do not processing, splice the power cord, or share a socket with other power plugs. This may cause fire or electric shock due to defecting contact, defecting insulation and over-current etc.

• Carry out the electrical work for ground lead with care.

Do not connect the ground lead to the gas line, water line, lightning conductor or telephone line's ground lead. Incorrect grounding can cause unit faults such as electric shocks due to short-circuiting.

4

## Use the circuit breaker with sufficient breaking capacity. capacity. If the breaker does not have sufficient breaking capacity, it

can cause the unit malfunction and fire.

Earth leakage breaker must be installed.

If the earth leakage breaker is not installed, it can cause ectric shocks

- Install isolator or disconnect switch on the powe supply wiring in accordance with the local codes
- supply wiring in accordance with the local codes and regulations.

  After maintenance, all wiring, wiring ties and the like, should be returned to their original state and wiring route, and the necessary clearance from all metal parts should be secured.

  Secure a space for installation, inspection and maintenance specified in the manual.

  Insufficient space can result in accident such as personal legion, the sto felling from the instellation place.
- Injury due to falling from the installation place
- **⚠** CAUTION Take care when carrying the unit by hand.
- If the unit weights more than 20kg, it must be carried by two or more persons. Do not carry by the plastic straps, always use the carry handle when carrying the unit by hand. Use gloves to minimize the risk of cuts by the aluminum fins.
- gloves to minimize the risk of cuts by the aluminum fins.

  \*Dispose of any packing materials correctly.

  Any remaining packing materials can cause personal injury as it contains nails and wood. And to avoid danger of suffocation, be sure to keep the plastic wrapper away from children and to dispose after tear it up.

  \*Be sure to insulate the refrigerant pipes so as not to condense the ambient air moisture on them.

  Insufficient insulation can cause condensation, which can lead to moisture damage on the ceiling, floor, furniture and any other valuables.
- When perform the air conditioner operation (cooling When perform the air conditioner operation (cooling or drying operation) in which ventilator is installed in the room. In this case, using the air conditioner in parallel with the ventilator, there is the possibility that drain water may backflow in accordance with the room lapse into the negative pressure status. Therefore, set up the opening port such as incorporate the air into the room that may appropriate to ventilation (For example; Open the door a little). In addition, just as above, so set up the opening port if the room lapse into negative pressure status due to register of the wind for the high rise apartment etc.

- Do not install the unit in the locations listed below.
   Locations where carbon fiber, metal powder or any powder is floating.
   Locations where any substances that can affect the unit such as sulphide gas, chloride gas, acid and alkaline can
  - Vehicles and ships.
- · Locations where cosmetic or special sprays are often used.
- . Locations with direct exposure of oil mist and steam such
- as kitchen and machine plant.
  Locations where any machines which generate high frequency harmonics are used.
- Locations with salty atmospheres such as coastlines.
   Locations with heavy snow (if installed, be sure to provide
- base flame and snow hood mentioned in the manual).

  Locations where the unit is exposed to chimney smoke.

  Locations at high altitude (more than 1000m high).

  Locations with ammonic atmospheres.

  Locations where heat radiation from other heat source can
- affect the unit.
- Locations without good air circulation.
- Locations with any obstacles which can prevent inlet and outlet air of the unit.
- Locations where short circuit of air can occur (in case of
- multiple units installation).
  Locations where strong air blows against the air outlet of outdoor unit.
- It can cause remarkable decrease in performance, corrosion and damage of components, malfunction and fire
- Do not install the outdoor unit in the locations listed
- Do not trace the second of the outdoor unit can bother neighborhood.

  Locations where outlet air of the outdoor unit blows

  Classification to plants.

- directly to plants. Locations where vibration can be amplified and transmitted due to insufficient strength of structure. Locations where vibration and operation sound gen
- by the outdoor unit can affect seriously (on the wall or at the place near bed room).
- I ocations where an equipment affected by high harmonis placed (TV set or radio receiver is placed within 1m).
- - Locations where drainage cannot run off safely.
     It can affect surrounding environment and cause a claim.

Do not install the unit near the location where leakage of combustible gases can occur.

If leaked gases accumulate around the unit, it can cause

III. Do not install the unit where corrosive gas (such as sulfurous acid gas etc.) or combustible gas (such as thinner and petroleum gases) can accumulate or collect, or where volatile combustible substances are

Corrosive gas can cause corrosion of heat exchanger, breakage of plastic parts and etc. And combustible gas can

cause ire.

Do not install nor use the system close to the equipment that generates electromagnetic fields or high frequency harmonics.

Equipment such as inverters, standby generators, medical high frequency equipments and telecommunication equipments can affect the system, and cause malfunctions

### **⚠** CAUTION

and breakdowns. The system can also affect medical equipment and telecommunication equipment, and obstruct its function or cause jamming.

Do not install the outdoor unit in a location where insects and small animals can enter the electric parts and cause described as a few parts and cause described as few parts and cause descri

cause damage or fire, Instruct the user to keep the surroundings clean.

Do not use the base flame for outdoor unit which is corroded or damaged due to long periods of operation.

Using an old and damage base flame can cause the unit falling down and cause personal injury.

Do not use any materials other than a fuse with the correct rating in the location where fuses are to be

used.
Connecting the circuit with copper wire or other metal thread can cause unit failure and fire.

- Do not touch any buttons with wet hands
- It can cause electric shocks.

   Do not touch any refrigerant pipes with your hands when the system is in operation. During operation the refrigerant pipes become extremely not or extremely cold depending the operating condition, and it
- can cause burn injury or frost injury.

   Do not touch the suction or alum outdoor unit.
- This may cause injury.

   Do not put anything on the outdoor unit and operating unit.
  This may cause damage the objects or injury due to falling

#### SELECTION OF INSTALLATION LOCATION

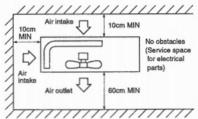

#### Install at location that meets the following conditions after getting approval from the customer.

- Where the following installation space is available, and where air does not gather.
- Where rain and sunlight do not directly hit the unit, and where there is enough air circulation.
- Also, where the unit cannot be buried by snow. a location which can sustain the weight of the unit, and where noises and vibrations are not enhanced.
- Where blasts of cold or hot air and noise do not bother the neighbors.
- Where the unit does not receive heat radiation from other heat sources.
- Where there are no obstructions (animals, plants, etc.) to the suction inlet and blowing outlet. · Where water may drain out.
- \* Please avoid the following locations Where there is constant exposure to harsh winds such as the top floors of a building. Also, locations with exposure to salty air.
- Where there are oil splashes, vapor, and smoke.
  Where there are possibilities of flammable gas leaks.

- ① Installation Space (on a flat surface)
  - OBlowing out port and suction port on the back side of the unit can be installed at a distance of 10cm from walls.

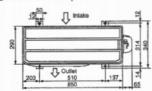

/ In case the barrier is 1.2m or above in height." or is overhead, the sufficient space between the unit and wall shall be secured.

OWhen the unit is installed, the space of the following dimension and above shall be secured.

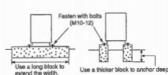

#### Installation

1 Anchor bolt fixed position

② Notabilia for installation

- In installing the unit, fix the unit's legs with bolts specified on the left.
- The protrusion of an anchor bolt on the front side must be kept within 15 mm.
- Securely install the unit so that it does not fall over during earthquakes or strong winds, etc.
- Refer to the above illustrations for information regarding concrete foundations.
- Install the unit in a level area. (With a gradient of 5 mm or less.)

Improper installation can result in a compressor failure, broken piping within the unit and abnormal noise generation.

#### 2 INSTALLATION OF OUTDOOR UNIT

#### (Drainage)

- There are 2 holes in the bottom panel of the outdoor unit to drain condensation.
- Install the outdoor unit so it will be horizontal.
   Also, secure the legs of the unit to a firm foundation to prevent any instabilities
- Secure it firmly so the unit will not fall during earthquakes and from sudden gusts of wind.
- In areas where the temperatures drop below 0°C for several continuous days, do not install a drain elbow. (water discharge could stop due to freezing.)

Connection of the power supply cable and the connecting cables for indoor and outdoor units.

- This multi-type room air conditioner receives its power from outside.
- To ensure correct connections, mark each ends of the cables with number. A to C. It
- is important to use the same number the corresponding cables and pipes.

   An earth leakage breaker and a circuit breaker must be installed. Their capacities are 25A.
- ①Remove the service panel. (Remove the screw of the service panel.)
- ②Remove the terminal cover. (Remove the screw of the terminal cover.) 3 Connect the power supply cable and the connection wire securely to the terminal block.

(POWER SUPPLY CODE)

CENELEC code for cables requiring fields cables. H05RNR3G4.0 (INTERCONNECTING WIRING CODE)

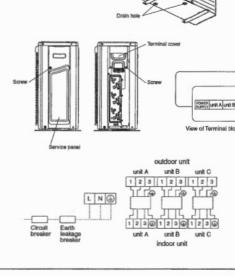

CENELEC code for cables requiring fields cables. H05RNR4G1.5

1) In wiring, make sure that the wire terminal numbers of outdoor unit terminal block are match to the wire terminal numbers of indoor unit terminal block.

2) Terminal number A of the outdoor unit is used for A indoor unit and terminal

number B for B Indoor unit respectively.

After connecting the wire, use wiring clamps to secure the wiring. (5) Fit the terminal cover and the service panel.

#### 3 CONNECTION OF REFRIGERANT PIPINGS

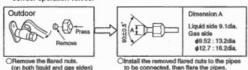

- Regarding the change in the sizes of gas side pipes (usage of the variable joints);
   If a 5.0, 6.0 kw class indoor unit (gas side pipe 12.7) is going to be connected to the operation valves (9.52), variable joints available as accessories must be applied to the gas side operation valves.
- Securely fit the copper packing between the operation valve and the variable diameter joint to prevent shifting.

#### [Connection of pipes]

#### NOTE

- Cover the pipes with tape so that dust and sand do not enter the pipe until they are connected.
- When connecting the pipes to the outdoor unit, be careful about the discharge of fluorocarbon gas or oil.

  • Make sure to match the pipes between the indoor unit and the outdoor unit with the
- correct operation valves

#### **⚠** CAUTION

**⚠** CAUTION Do not apply excess torque to the flared nuts. Otherwise, the flared nuts may crack depending on the conditions and refrigerant leak may occur.

Do not apply refrigerating machine oil to the flared surface.

#### [Examples of use of variable diameter joints]

Connection of indoor unit of Class 5.0 to A unit.

| Copper pipe<br>diameter | Measurement B (mm)         |                               |               |  |  |  |
|-------------------------|----------------------------|-------------------------------|---------------|--|--|--|
|                         | Clutch typr flare tool for | Conventional (R22) flare tool |               |  |  |  |
|                         | R410A                      | Clutch type                   | Wing nut type |  |  |  |
| ¢6.35                   | 0.0~0.5                    | 1.0~1.5                       | 1.5~2.0       |  |  |  |
| φ9.52                   | 0.0~0.5                    | 1.0~1.5                       | 1.5~2.0       |  |  |  |

Use a flare tool designed for R410A or a conventional flare tool. Please note that measurement B (protrusion from the flaring block) will vary depending on the type of a The answer of the state of the

#### Connection

#### Outdoor

Liquid side

OConnect the pipes on both liquid and gas sides O'Connect win pipes on sour inputs and year of the Connect win pipes on sour inputs and year.

O'Tighten the nuts to the following forque.

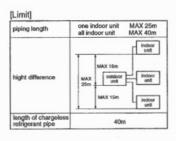

Liquid side: 14.0~18.0N-m (1.4~1.8kgf·m)

Gas side (\$9.52): 33.0~42.0N·m (3.3~4.2kgf·m)

(\$12.7): 49.0~61.0N·m (4.9~6.1kgf·m)

#### Gas Leakage Test

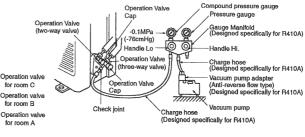

●Ensure that there are no gas leaks from the pipe joints by using a leak detector or soap water

# 4 **AIR PURGING Procedure**

NOTE: Fully open the operation valves (on both liquid and gas sides) after completing air purging.

- Since the system uses service ports differing in diameter from those found on the conventional models, a charge hose (for R22) presently in use is not applicable. Please use one designed specifically for R410A.
- Remove the cap on both gas and liquid sides before starting operation.
- After completing the operation, do not forget to tighten the cap (gas may leak).
- Please use an anti-reverse flow type vacuum pump adapter so as to prevent vacuum pump oil from running back into the system. Oil running back into an air-conditioning system may cause the refrigerant cycle to break down.
- Conduct air purging for all connected indoor units.

Securely tighten the operation valve cap and the check joint blind nut after ad-

| Operation valve size<br>(mm) | Operation valve cap<br>tightening torque (N-m) | Check joint blind nut<br>tightening torque (N-m) |  |
|------------------------------|--|--|--|
| φ 6.35 (1/4")                | 00.00  |  |  |
| φ 9.52 (3/8")                | 20~30  | 10~12  |  |
| φ 12.7 (1/2")                | 25~35  |  |  |

- Secure all flare nuts on both Indoor and outdoor sides to prevent leaks from the pipes.
   Connect the operation valves, charge hose, manifold the prevent and valves and valves.
- valve and vacuum pump as shown in the right figure.
- (3) Fully open the handle Lo for the manifold valve, and pump a vacuum for 15 minutes. Ensure that the meter is indicating -0.1MPa (-76cmHg).

  (4) After vacuuming, fully open the operation valve (both
- liquid and gas sides) with a hexagon wrench

- (5) Remove the charge hose from service port.(6) Repeat the above steps (1) ~ (5) for all connected indoor units.
- (6) Repeat the above steps (1) ~ (5) for all connected indoor units.
  (7) Ensure that there are no gas leaks from the joints in the indoor and outdoor units.

#### **HEAT INSULATION FOR JOINTS**

Cover the joint with insulation material for the indoor unit and tape it.

#### Finish and fixing

Apply exterior tape and shape along the place where the pipes will be routed. Secure to the wall with a pipe clamp. Be careful not to damage the

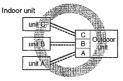

#### **BEWARE OF WRONG CONNECTIONS IN** REFRIGERANT PIPING AND WIRING

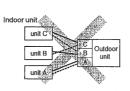

- Make sure to match the piping and wiring from each unit to the outdoor unit
- Be careful because if connections are wrong, normal operation cannot be achieved and may damage the compresso

#### [Correct connections]

[Example of wrong connections]

#### **EARTHING WORK**

- O Earth work shall be carried out without fail in order to prevent electric
- shock and noise generation.

  O The connection of the earth cable to the following substances causes dangerous failures, therefore it shall never be done. (City water pipe, Town gas pipe, TV antenna, lightning conductor, telephoneline, etc.)

## **TEST RUN AND HANDLING INSTRUCTIONS**

#### Installation test check points

Check the following points again after completion of the installation, and before

turning on the power.

Conduct a test run again and ensure that the unit operates properly.

At the same time, explain to the customer how to use the unit and how to take care of the unit following the installation manual.

If the compressor does not operate after the operation has started, wait for 5-10 minutes. (This may be due to delayed start.)

(Three-minutes restart preventive timer)

When the air conditioner is restarted or when changing the operation, the unit will not start operating for approximately 3minutes. This is to protect the unit and it is not a malfunction.

#### After installation

- The power supply voltage is correct as the rating.

  No gas leaks from the joints of the operation valve.

  Power cables and crossover wires are securely fixed to the terminal board.

  Each indoor and outdoor unit is properly connected (no wrong wiring or piping).
- Operation valve is fully open.

  Refrigerant has been additionally charged (when the total pipe length exceeds
- the refrigerant charged pipe length.

  The pipe joints for indoor and outdoor pipes have been insulated.

  Earthing work has been conducted properly.

#### Test run

- Air conditioning and heating are normal.

  No abnormal noise.

  Water darias smoothly.

  Protective functions are not working.

  Operation of the unit has been explained to the customer.

  The remote control is normal.

#### Operation of indicator lamps

| INDICATION LAMP                       | COLOR                     | FUNCTION             |

- This installation manual deals with outdoor units and general installation specifications only. For indoor units, refer to page 139 and 160.
   When install the unit, be sure to check whether the selection of installation place, power supply specifications, usage limitation (piping le indoor and outdoor units, power supply voltage and etc.) and installation spaces. ion (piping length, height differences between

#### **SAFETY PRECAUTIONS**

- We recommend you to read this "SAFETY PRECAUTIONS" carefully before the installation wo in order to gain full advantage of the functions of the unit and to avoid malfunction due to mishandling.
- The precautions described below are divided into **WARNING** and **CAUTION**. The matters with possibilities leading to serious consequences such as death or serious personal injury due to erroneous handling are listed in the AWARNING and the matters with possibilities leading to personal injury or damage of the unit due to erroneous handling including probability leading to serious consequences in some cases are listed in **ACAUTION**. These
- probability bearing to serious consequences in solite cases are near in the transfer of the case are very important precautions for safety. Be sure to observe all of them without fail, the Be sure to confirm no anomaly on the equipment by commissioning after completed installation and explain the operating methods as well as the maintenance methods of this equipment to
- the user according to the owner's manual.
- Keep the installation manual together with owner's manual at a place where any user can read at any time. Moreover if necessary, ask to hand them to a new user.
- at any time, moreover in recessary, ask to main them to a new user.

  For installing qualified personnel, take precautions in respect to themselves by using suitable protective clothing, groves, etc., and then perform the installation works.

  Please pay attention not to fall down the tools, etc. when installing the unit at the high position.
- . If unusual noise can be heard during operation, consult the dealer.
- . Symbols which appear frequently in the text have the following meaning:

Provide proper earthing

Installation must be carried out by the qualified installer.
 If you install the system by yourself, it may cause serious trouble such as water leaks, electric shocks, fire and personal injury, as a result of a system malfunction.
 Install the system in full accordance with the instruction manual.
 Incorrect installation may cause bursts, personal injury, water leaks electric shocks and fire.

ater leaks, electric shocks and fire Be sure to use only for household and residence.

If this appliance is installed in inferior environment such as machine shop and etc., it can cause malfunction.

• Use the original accessories and the specified

Use the original accessories and the specified components for installation.
If parts other than those prescribed by us are used, it may cause water leaks, electric shocks, fire and personal injury.
Install the unit in a location with good support.
Unsuitable installation locations can cause the unit to fall and cause material damage and personal injury.
Ensure the unit is stable when installed, so that it can withstand earthquakes and strong winds.

withstand earthquakes and strong winds.
Unsuitable installation locations can cause the unit to fall and cause material damage and personal rijury.
Ventilate the working area well in the event of refrigerant leakage during installation.
If the refrigerant comes into contact with naked flames, poisonous assis produced.

poisonous gas is produced.
Use the prescribed pipes, flare nuts and tools fo R410A.

N410A Using existing parts (for R22 or R407C) can cause the unit failure and serious accidents due to burst of the refrigeran

\*\*No not processing, splice the power cord, or share a socket with other power plugs.

This may cause fire or electric shock due to defecting contact, defecting insulation and over-current etc.

 ⚠ WARNING

Tighten the flare nut by torque wrench with specified method.
If the flare nut were tightened with excess torque, this may cause burst and refrigerant leakage after a long period.
Do not open the operation valves for liquid line and gas line until completed refrigerant piping work, air tightness test and evacuation.

tightness test and evacuation.
If the compressor is operated in state of opening operation valves before completed connection of refrigerant piping work, air can be sucked into refrigerant circuit, which can cause bust or personal injury due to anomalously high

pressure in the refrigerant.

The electrical installation must be carried out by the qualified electrician in accordance with "the norm for electrical work" and "national wiring regulation", and the system must be connected to the dedicated

circuit. Power supply with insufficient capacity and incorrect function done by improper work can cause electric shocks nd fire.

Be sure to shut off the power before starting electrical

work.
Failure to shut off the power acra cause electric shocks, unit failure or incorrect function of equipment.

Be sure to use the cables conformed to safety standard and cable ampacity for power distribution

work.
Unconformable cables can cause electric leak, anomalous heat production or fire.
This appliance must be connected to main power supply by means of a circuit breaker or switch (fuse:25A) with a contact separation of at least 3mm.

Do not bundling, winding or processing for the power cord. Or, do not deforming the power plug due to

tread it.
This may cause fire or heating.
Do not run the unit with removed panels or protections.
Touching rotating equipments, hot surfaces or high voltage parts can cause personal injury due to entrapment, burn or electric shocks.

 Use the prescribed cables for electrical connection, tighten the cables securely in terminal block and relieve the cables correctly to prevent overloading the terminal blocks

oose connections or cable mountings can cause nomalous heat production or fire

Arrange the wiring in the control box so that it cannot be pushed up further into the box. Install the service panel correctly.

Incorrect installation may result in overheating and fire.

Be sure to fix up the service panels.
Incorrect fixing can cause electric shocks or fire due to intrusion of dust or water.

 Be sure to switch off the power supply in the event of installation, inspection or servicing.

If the power supply is not shut off, there is a risk of electric shocks, unit failure or personal injury due to the unexpected

Stop the compressor before disconnecting refrigerant

• Stop the compressor before disconnecting refrigerar pipes in case of pump down operation. If disconnecting refrigerant pipes in state of opening operation valves before compressor stoping, air can be sucked, which can cause burst or personal injury due to anomalously high pressure in the refrigerant circuit • Only use prescribed optional parts. The installation must be carried out by the qualified installer, if you install the system by yourself, it can cause serious trouble such as water leaks, electric shocks, fire.

# Ensure that no air enters in the refrigerant circuit when the unit is installed and removed.

If air enters in the refrigerant circuit, the pressure in the refrigerant circuit becomes too high, which can cause burst and personal injury.

tread it.

Do not perform any change of protective device itself or its setup condition.

or us setup condution.
The forced operation by short-circuiting protective device of pressure switch and temperature controller or the use of non specified component can cause fire or burst.

• Carry out the electrical work for ground lead with care.

Do not connect the ground lead to the gas line, water line, lightning conductor or telephone line's ground lead. Incorrect grounding can cause unit faults such as electric shocks due to short-circuiting.

#### Use the circuit breaker with sufficient breaking

capacity.

If the breaker does not have sufficient breaking capacity, it ause the unit malfunction and fire

Earth leakage breaker must be installed. If the earth leakage breaker is not installed, it can cause

Install isolator or disconnect switch on the power supply wiring in accordance with the local codes and

supply wiring in accordance with the local course and regulations.

\* After maintenance, all wiring, wiring ties and the like, should be returned to their original state and wiring route, and the necessary clearance from all metal parts should be secured.

\* Secure a space for installation, inspection and maintenance specified in the manual.

Insufficient space can result in accident such as personal injury due to falling from the installation place.

#### **⚠** CAUTION

Take care when carrying the unit by hand.

If the unit weights more than 20kg, it must be carried by two rmore persons. Do not carry by the plastic straps, always use the carry handle when carrying the unit by hand. Use ust be carried by two

gloves to minimize the risk of cuts by the aluminum fins.

Dispose of any packing materials correctly. Any remaining packing materials can cause personal injury as it contains nails and wood. And to avoid danger of suffocation, be sure to keep the plastic wrapper away from

sullocation, be ster to keep the plastic wrapper away from children and to dispose after tear it up.

Be sure to insulate the refrigerant pipes so as not to condense the ambient air moisture on them. Insufficient insulation can cause condensation, which can lead to moisture damage on the ceiling, floor, furniture and any other valuables.

 When perform the air conditioner operation (cooling) or drying operation) in which ventilator is installed in the room. In this case, using the air conditioner in parallel with the ventilator, there is the possibility that drain water may backflow in accordance with the room lapse into the negative pressure status. room lapse into rine negative pressure status as incorporate the air into the room that may appropriate to ventilation (For example; Open the door a little), In addition, just as above, so set up the opening port if the room lapse into negative pressure status due to register of the wind for the high rise apartment etc.

# • Do not install the unit in the locations listed below.

- Locations where carbon fiber, metal powder or any powder is floating.
   Locations where any substances that can affect the unit such as sulphide gas, chloride gas, acid and alkaline can
- occur.

   Vehicles and ships.
   Locations where cosmetic or special sprays are ofter
- Locations with direct exposure of oil mist and steam such as kitchen and machine plant.

  Locations where any machines which generate high frequency harmonics are used.

  Locations with salty atmospheres such as coastlines.

  Locations with heavy snow (If installed, be sure to provide

- base flame and snow hood mentioned in the manual).
- Locations where the unit is exposed to chimney smoke.
   Locations at high allitude (more than 1000m high).
   Locations with ammonic atmospheres.
   Locations where heat radiation from other heat source can

Locations where heat radiation from other heat source can affect the unit.
Locations without good air circulation.
Locations with any obstacles which can prevent inlet and outlet air of the unit.
Locations where short circuit of air can occur (in case of multiple units installation).
Locations where strong air blows against the air outlet of outdoor unit.
It can cause remarkable decrease in performance, corrosion and damage of components, malfunction and fire.

- Do not install the outdoor unit in the locations listed

- bo for install me autdoor unit in the rocations isseed below.

  Locations where discharged hot air or operating sound of the outdoor unit can bother neighborhood.

  Locations where outlet air of the outdoor unit blows directly to plants.

  Locations where vibration can be amplified and transmitted due to insufficient strength of structure.

  Locations where vibration and operation sound generated by the outdoor unit can affect seriously (on the wall or at the place near bed room).

  Locations where an equipment affected by high harmonics is placed (TV set or radio receiver is placed within 1 m).

  Locations where drainage cannot run off safely, it can affect surrounding environment and cause a claim.

#### • Do not install the unit near the location where leakage of combustible gases can occur. If leaked gases accumulate around the unit, it can cause

Do not install the unit where corrosive gas (such as sulfurous acid gas etc.) or combustible gas (such as thinner and petroleum gases) can accumulate or collect, or where volatile combustible substances are handled.

Corrosive gas can cause corrosion of heat exchanger, breakage of plastic parts and etc. And combustible gas can

Do not install nor use the system close to the equipment that generates electromagnetic fields or high frequency harmonics. Equipment such as inverters, standby generators, medical high frequency equipments and telecommunication

equipments can affect the system, and cause malfunctions

#### **⚠** CAUTION

- and breakdowns. The system can also affect medical equipment and telecommunication equipment, and obstruct ts function or cause jamming. Do not install the outdoor unit in a location where
- insects and small animals can inhabit, Insects and small animals can innabit,
  Insects and small animals can enter the electric parts and
  cause damage or fire. Instruct the user to keep the
- surroundings clean.

  Do not use the base flame for outdoor unit which is corroded or damaged due to long periods of operation.

ing an old and damage base flame can cause the unit

osing an old and damage base flame can cause the unit falling down and cause personal injury.

• Do not use any materials other than a fuse with the correct rating in the location where fuses are to be used.

Connecting the circuit with copper wire or other metal thread can cause unit failure and fire.

Do not touch any buttons with wet hands.
It can cause electric shocks.

outdoor unit.

No not touch any refrigerant pipes with your hands when the system is in operation. During operation the refrigerant pipes become extremely hot or extremely cold depending the operating condition, and it

can cause burn injury or frost injury.

• Do not touch the suction or aluminum fin on the

This may cause injury.

• Do not put anything on the outdoor unit and operating

unit.
This may cause damage the objects or injury due to falling to the object.

#### SELECTION OF INSTALLATION LOCATION 1

#### Install at location that meets the following conditions after getting approval from the customer.

- Where the following installation space is available, and where air does not gather.
- Where rain and sunlight do not directly hit the unit, and where there is enough air circulation. Also, where the unit cannot be buried by snow.
- a location which can sustain the weight of the unit, and where noises and vibrations are not enhanced.
- Where blasts of cold or hot air and noise do not bother the neighbors.
- Where the unit does not receive heat radiation from other heat sources • Where there are no obstructions (animals, plants, etc.) to the suction inlet and blowing outlet.
- Where water may drain out.
- \* Please avoid the following locations
- Where there is constant exposure to harsh winds such as the top floors of a building. Also, locations with exposure to salty air.

  • Where there are oil splashes, vapor, and smoke.
- Where there are possibilities of flammable gas leaks.

- 1 Installation Space (on a flat surface)
  - OBlowing out port and suction port on the back side of the unit can be installed at a distance of 10cm from walls.
    - In case the barrier is 1.2m or above in height, or is overhead, the sufficient space between the unit and wall shall be secured.
  - OWhen the unit is installed, the space of the following dimension and above shall be secured.

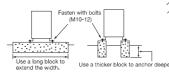

#### Installation

1) Anchor bolt fixed position

② Notabilia for installation

- In installing the unit, fix the unit's legs with bolts specified on the left.
- The protrusion of an anchor bolt on the front side must be kept within 15 mm.
- Securely install the unit so that it does not fall over during earthquakes or strong winds, etc.
- Refer to the above illustrations for information regarding concrete foundations.
- Install the unit in a level area. (With a gradient of 5 mm or less.)

Improper installation can result in a compressor failure, broken piping within the unit and abnormal noise generation.

#### 2 **INSTALLATION OF OUTDOOR UNIT**

#### Drainage )

- There are 3 holes in the bottom panel of the outdoor unit to drain condensation.

- Install the outdoor unit so it will be horizontal.

  Also, secure the legs of the unit to a firm foundation to prevent any instabilities.

  Secure it firmly so the unit will not fall during earthquakes and from sudden gusts of wind.

  In areas where the temperatures drop below 0°C for several continuous days, do not install a drain elbow. (water discharge could stop due to freezing.)

# Connection of the power supply cable and the connecting cables for indoor and outdoor units.

- This multi-type room air conditioner receives its power from outside.
   To ensure correct connections, mark each ends of the cables with number, A to D. It
- is important to use the same number the corresponding cables and pipes.

   An earth leakage breaker and a circuit breaker must be installed. Their capacities are 25A.
- ①Remove the service panel.(Remove the 2 sets screws of the service panel.)
  ②Remove the terminal cover.(Remove the 2 sets screws of the terminal cover.)
  ③Connect the power supply cable and the connection wire securely to the terminal block.

(POWER SUPPLY CODE)

CENELEC code for cables requiring fields cables. H05RNR3G4.0 (INTERCONNECTING WIRING CODE)

CENELEC code for cables requiring fields cables. H05RNR4G1.5

- In wiring, make sure that the wire terminal numbers of outdoor unit terminal block are match to the wire terminal numbers of indoor unit terminal block.
   Terminal number A of the outdoor unit is used for A indoor unit and terminal
- number B for B indoor unit respectively.
- After connecting the wire, use wiring clamps to secure the wiring.
- 5Fit the terminal cover and the service panel.

#### 3 **CONNECTION OF REFRIGERANT PIPINGS**

- Regarding the change in the sizes of gas side pipes (usage of the variable joints);
   If a 5.0, 6.0 kw class indoor unit (gas side pipe 12.7) is going to be connected to the operation valves (9.52), variable joints available as accessories must be applied to the gas side operation valves.
- Securely fit the copper packing between the operation valve and the variable diameter joint to prevent shifting.

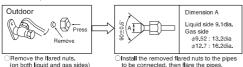

#### [Connection of pipes]

#### NOTE

- $\bullet$  Cover the pipes with tape so that dust and sand do not enter the pipe until they are
- connected.

   When connecting the pipes to the outdoor unit, be careful about the discharge of fluorocarbon
- gas or oil.

   Make sure to match the pipes between the indoor unit and the outdoor unit with the correct operation valves

Remove the flared nuts. (on both liquid and gas sides)

#### **⚠** CAUTION

**⚠** CAUTION Do not apply excess torque to the flared nuts. Otherwise, the flared nuts may crack depending on the conditions and refrigerant leak may occur.

Do not apply refrigerating machine oil to the flared surface.

#### [Examples of use of variable diameter joints]

●Connection of indoor unit of Class 5.0 to A unit.

indoor unit

|                         | Measurement B (mm)         |             |                      |  |  |  |
|-------------------------|----------------------------|-------------|----------------------|--|--|--|
| Copper pipe<br>diameter | Clutch type flare tool for | Convention  | nal (R22) flare tool |  |  |  |
| diameter                | R410A                      | Clutch type | Wing nut type        |  |  |  |
| $\phi$ 6.35             | 0.0~0.5                    | 1.0~1.5     | 1.5~2.0              |  |  |  |
| φ9.52                   | 0.0~0.5                    | 1.0~1.5     | 1.5~2.0              |  |  |  |
| φ12.7                   | 0,0~0,5                    | 1.0~1.5     | 2,0~2,5              |  |  |  |

Use a flare tool designed for R410A or a conventional flare tool. Please note that measurement B (protrusion from the flaring block) will vary depending on the type of a flare tool in use. If a conventional flare tool in sused, please use a copper pipe gauge or a similar instrument to check protrusion so that you can keep measurement B to a correct value.

#### Connection

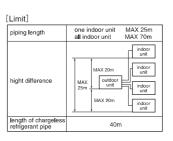

#### Outdoor

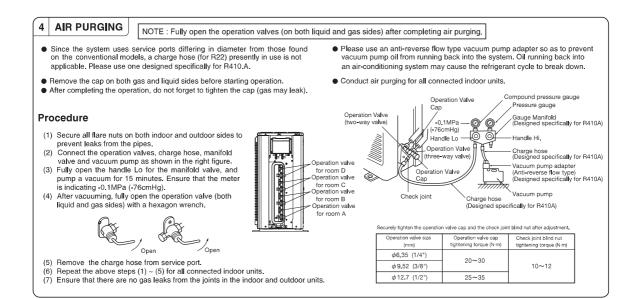

Connect the pipes on both liquid and gas sides ↑Tighten the nuts to the following torque.
Liquid side : 14.0∼18.0N·m (1.4~1.8kg·m)
Gas side (\$9.52):33.0~42.0N·m (3.3~4.2kg·m)
(\$12.7): 49.0~61.0N·m (4.9~6.1kg·m) ● When the total refrigerant pipe lenght for all the rooms exceeds the length of the uncharged pipe (40m), additional refrigerant is required. (If 40m or less, additional charge is not required.) Additional charge amount per meter = 20g/m

#### Gas Leakage Test

Ensure that there are no gas leaks from the pipe joints by using a leak detector or soap water.

#### Position so the slit comes on top Cover the joint with insulation material for the indoor unit and tape it. Finish and fixing Apply exterior tape and shape along the place where the pipes will be routed. Secure to the wall with a pipe clamp. Be careful not to damage the pipes and the wires. -Pipe clamp Exterior tape Drain hos Tapping screw BEWARE OF WRONG CONNECTIONS IN REFRIGERANT PIPING AND WIRING. • Make sure to match the piping and wiring from each unit to the outdoor unit Be careful because if connections are wrong, normal operation cannot be achieved and may damage the compressor [Correct connections] [Example of wrong connections] Piping Wiring Indoor unit Indoor unit D unit D unit C unit C unit

B unit A unit

В unit

5

- Earth work shall be carried out without fail in order to prevent electric
- shock and noise generation.

  The connection of the earth cable to the following substances causes dangerous failures, therefore it shall never be done. (City water pipe, Town gas pipe, TV antenna, lightning conductor, telephoneline, etc.)

#### **TEST RUN AND HANDLING INSTRUCTIONS**

#### Installation test check points

Check the following points again after completion of the installation, and before

Check the following points again after completion of the installation, and before turning on the power.

Conduct a test run again and ensure that the unit operates properly. At the same time, explain to the customer how to use the unit and how to take care of the unit following the installation manual. If the compressor does not operate after the operation has started, wait for 5-10 minutes, (This may be due to delayed start.) (Three-minute restart preventive timer)

When the air conditioner is restarted or when changing the operation, the unit will not start operating for approximately 3minutes. This is to protect the unit and it is not a malfunction.

#### After installation

- The power supply voltage is correct as the rating.

  No gas leaks from the joints of the operation valve.

  Power cables and crossover wires are securely fixed to the terminal board.

  Each indoor and outdoor unit is properly connected (no wrong wiring or piping).

  Operation valve is fully open.

  Refrigerant has been additionally harged (when the total pipe length exceeds
- the refrigerant charged pipe length). The pipe joints for indoor and outdoor pipes have been insulated.
- ☐ The pipe joints for indoor and outdoor properly.
  ☐ Earthing work has been conducted properly.

#### Test run

- Air conditioning and heating are normal.

  No abnormal noise.
  Water drains smoothly.
  Protective functions are not working.
  Operation of the unit has been explained to the customer.
  The remote control is normal.

#### Operation of indicator lamps

| INDICATION LAMP                       | COLOR                                  | FUNCTION              |  |

#### 1 SELECTION OF INSTALLING LOCATION

(Install the unit with the customer's consent at a location that meets the following conditions.)

- Where there are no barriers to the breeze, and where cool/hot air may diffuse throughout the room.

  A firm location that may sustain the weight of the unit, and do not cause the unit or the collective before.

- the room.

  A firm location that may sustain the weight of the unit, and do not cause the unit or the ceiling to Vbrate.

  A firm location that was come for maintenance.

  A location that was come for maintenance.

  Where witing and plumbing may be performed with ease.

  Where witing and plumbing may be performed with ease.

  Where the unit is not influenced by the television, stereo, radio, or the lights.

  Where the unit is not influenced by high frequency equipment and wiring equipment.

  Where can light and strong lights do not directly hit the receiver.

  A flat ceiling surface (bottom of ceiling).

  Where the subtion inlet of the unit is located far from the air inlet on the ceiling, the entire inside of ceiling acts as an air suction duct of that the capacity is reduced at the startup. In such occasion, it is recommended to install a duct at the air suction side.

  Where the suction inlet of the unit does not match the air inlet and there is not sufficient clearance between the unit and the ceiling face, the capacity is reduced. It is necessary to enable the air suction from the back by using optional parts & (Back side suction filter set model RBF12).

- Wireless remote control

  Where the main unit can definitely detect the signals from the wireless remote control.

  Where it is not influenced by television or stereo.

  Avoid locations with direct surplipt or around heaters.

  Do not attach to weak walls such as a mud wall.

#### Maximum pipe length

The maximum lengths and height differences for the pipes differ according to their outdoor unit. Please refer the Installation Instructions for the outdoor unit.

#### Installation of wireless remote control

Mounting method of battery

○ Uncover the wireless remote control, and mount the batteries IR03 (AAA, Micro)×2 pieces] in the body regularly. (Fit the poles with the indication marks, ⊕ & ⊖ without fail)

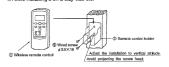

#### Fixing to pillar or wall

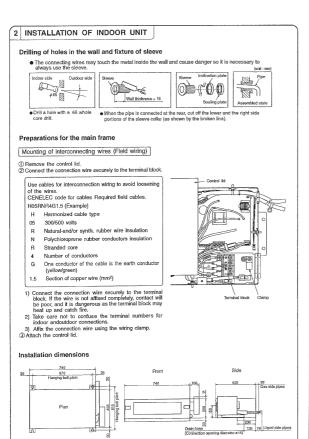

- O Conventionally, operate the wireless remote control by holding in your hand.

  O In the case of stationary operation service as by mounting on the holder for the wireless remote control, make sure that the locating place is satisfactory for access service before installing it.

  O Avoid installing it on a clsy wall etc.

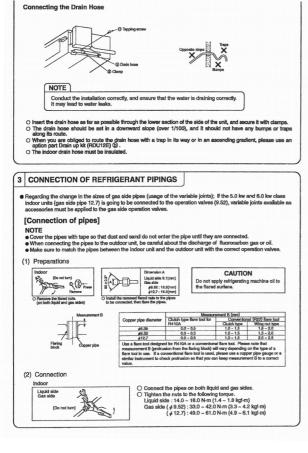

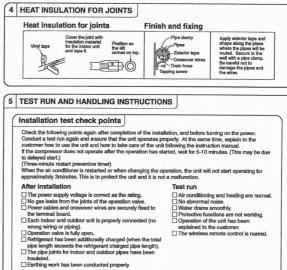

Unit main body LS2

## **FARTHING WORK**

- O Earth work shall be carried out without fall in order to prevent electric shock and noise generation.

  O The connection of the earth cable to the following substances causes dangerous failures, therefore it shall never be done. (CBy water pipe, Town gas pipe, TV antenna, lightning conductor, telephoneline, etc.)

## **GAS LEAK DETECTOR**

Check that there are no gas leaks from the pipe joints using a leak detector or soap water.

smoke from a chimney

This manual is for the installation of an indoor unit.

For electrical wiring work (Indoor), refer to the electrical wiring work installation manual. For remote controller installation, refer to the installation manual attached to a remote controller. For wireless kit installation, refer to the installation manual attached to a wireless kit. For electrical wiring work (Outdoor) and refrigerant pipe work installation for outdoor unit, refer to page 127 and 138 This unit must always be used with the panel.

#### **SAFETY PRECAUTIONS**

- Read the "SAFETY PRECAUTIONS" carefully first of all and then strictly follow it during the installation work in order to protect yourself.
- A WARNING: Wrong installation would cause serious consequences such as injuries or death.

  A CAUTION : Wrong installation might cause serious consequences depending on circumstances Both mentions the important items to protect your health and safety so strictly follow them by any means.
- The meanings of "Marks" used here are as shown as follows:

  Solver do it under any circumstances.

  Aways do it secording to the instruction.
- After completing the installation, do commissioning to confirm there are no abnormalities, and explain to the customers about "SAFETY PRECAUTIONS", correct operation method and maintenance method (air filter cleaning, operation method and temperature setting method) with user's manual of this unit. Ask your customers to keep this installation manual together with the user's manual. Also, ask them to hand over the user's manual to the new user when the owner is changed.

### **⚠WARNING**

Installation should be performed by the specialist.

rself, it may lead to serious trouble such as water leakage, electric shock, fire, and injury due to overturn of the unit

Install the system correctly according to these installation manuals

Improper installation may cause explosion, injury, water leakage, electric shock, and fire

•When installing in small rooms, take prevention measures not to exceed the density limit of refrigerant in the event of leakage, referred by the formula (accordance with ISO5149).

If the density of refrigerant exceeds the limit, please consult the dealer and install the ventilation system, otherwise lack of oxygen can occur, which can cause serious accidents

•Use the genuine accessories and the specified parts for installation.

0 specified by our company are used it could cause water leakage, electric shock, fire, and injury due to overturn of the unit

Ventilate the working area well in case the refrigerant leaks during installation.

If the refrigerant contacts the fire, toxic gas is produced. Install the unit in a location that can hold heavy weight.

•Install the unit properly in order to be able to withstand strong winds such as typhoons, and earthquakes. per installation may cause the unit to fall leading to accidents

●Do not mix air in to the cooling cycle on installation or removal of the air conditioner

If air is mixed in, the pressure in the cooling cycle will rise abnormally and may cause explosion and injuries Be sure to have the electrical wiring work done by qualified electrical installer, and use exclusive circuit.

urce with insufficient capacity and improper work can cause electric shock and fire

Use specified wire for electrical wiring, fasten the wiring to the terminal securely, and hold the cable securely in order not to apply unexpected stress on the terminal.

Loose connections or hold could result in abnormal heat generation or fire

Arrange the electrical wires in the control box properly to prevent them from rising. Fit the lid of the services

nproper fitting may cause abnormal heat and fire

Check for refrigerant gas leakage after installation is completed If the refrigerant gas leaks into the house and comes in contact with a fan heater, a stove, or an oven, toxic gas is produced

●Use the specified pipe, flare nut, and tools for R410A.

ing existing parts (R22) could cause the unit failure and serious accident due to explosion of the cooling cycle Tighten the flare nut according to the specified method by with torque wrench.

f the flare nut were tightened with excess torque, it could cause burst and refrigerant leakage after a long p ● Do not put the drainage pipe directly into drainage channels where poisonous gases such as sulfide gas can occur.

Poisonous gases will flow into the room through drainage pipe and seriously affect the user's health and safety This can also cause the corrosion of the indoor unit and a resultant unit failure or refrigerant leak.

Connect the pipes for refrigeration circuit securely in installation work before compressor is operated. If the compressor is operated when the service valve is open without connecting the pipe, it could cause explosion and injurie to abnormal high pressure in the system

Stop the compressor before removing the pipe after shutting the service valve on pump down work. If the pipe is removed when the compressor is in operation with the service raive open, air would be mixed in the refrigeratio and it could cause explosion and injuries due to abnormal high pressure in the cooling cycle.

Only use prescribed optional parts. The installation must be carried out by the qualified installer

If you install the system by yourself, it can cause serious trouble such as water leaks, electric shocks, fire.

Do not repair by yourself. And consult with the dealer about regair. mproper repair may cause water leakage, electric shock or fire

Consult the dealer or a specialist about removal of the air conditioner.

use water leakage, electric shock or fire

 $\bullet \mbox{Turn off the power source during servicing or inspection work.}$ If the power is supplied during servicing or inspection work, it could cause electric shock and injury by the operating fan

Do not run the unit when the panel or protection guard are taken off.

Touching the rotating equipment, hot surface, or high voltage section could cause an injury to be caught in the machine, to get burned, or electric shock.

Shut off the power before electrical wiring work.

It could cause electric shock, unit failure and improper running

#### **⚠ CAUTION**

Perform earth wiring surely.

ect the earth wiring to the gas pipe, water pipe, lightning rod and telephone earth wiring. Improper earth ci

Earth leakage breaker must be installed.

If the earth leakage breaker is not installed, it can cause electric shocks

 Use the circuit breaker of correct capacity. Circuit breaker should be the one that disconnect al poles under over current.

ing the incorrect one could cause the system failure and fire Do not use any materials other than a fuse of correct capacity where a fuse should be used.

eding the circuit by wire or copper wire could cause unit failure and fire Do not install the indoor unit near the location where there is possibility of flammable gas leakage If the gas leaks and gathers around the unit, it could cause fire.

 Do notinstall and use the unit where corrosive gas (such as sulfurous acid gas etc.) or flammable gas (such as sthirmer, petroleum etc.) may be generated or accumulated, or volatile flammable substances are handled. It could cause the corrosion of heat exchanger, breakage of plastic parts etc. And inflammable gas could cause fire

Secure a space for installation, inspection and maintenance specified in the marual

an result in accident such as personal injury due to falling from the i

Do not use the indoor unit at the place where water splashes such as laundry.

Do not use the indoor unit for a special purpose such as food storage, cooling for precision instrument, preservation of animals, plants, and a work of art.

Do notinstall nor use the system near equipments which generate electromagnetic wave or high harmonics

Equipments like inverter equipment, private power generator, high-frequency medical equipment, or telecc equipment might influence the air conditioner and cause a malfunction and breakdown. Or the air condition nts, and obstruct their medical activity or cause jam

 Do not install the remote controller at the direct sunlight. t could cause breakdown or deformation of the remote control

Do not install the indoor unit at the place listed below.

Jo not install the indoor unit at me piace listed below. Places where farmable gas could leak. Places where carbon fiber, metal powder or any powder is floated. Place where the substances which affect the air conditioner are generated such as shifting such kindir or amornic atmospheres. Places exposed to oil mist or steam directly. The whitele and the place is the place is

On vehicles and ships Places where machinery which generates high harmonics is used.

Altitude over 1000n • riacs where machinery which generates high harmonis is used. Allitude over 1000m
• Do not install the indoor unit in the locations listed below (Be sure to install the indoor unit according to the installation manual for each model because each indoor unit has each limitation).
• Locations with any obstacles which can prevent inlet and outlet air of the unit.
• Locations where vibration can be amplified the to insufficient strength of structure.
• Locations where the infraed receiver is exposed to the direct sunlight or the strong light beam, (in case of the infraed specification unit).
• Locations where an equipment affected by high harmonics is placed. (IV set or radio receiver's placed within 5m).
• Locations where drainage cannot run off safely.
It can affect performance or function and etc.

Do not put any valuables which will break down by getting wet under the air conditioner

Do not use the base frame for the outdoor unit which is corroded or damaged after a long period of use.

d cause the unit falling down and injury.

Pay attention not to damage the drain pan by weld sputter when brazing work is done near the unit utter entered into the unit during brazing work, it could cause damage (pinhole) of drain par and leakage oil damaging, keep the indoor unit packed or cover the indoor unit.

Install the drain pipe to drain the water surely according to the installation manual.

 Do not share the drain pipe for indoor unit and GHP (Gas Heat Pump system) outdoor unit. xic exhaust gas would flow into room and it might cause serious damage (some poisoning or Jeficiency of c er's lealth and safety.

■ Be sure to perform air tightness test by pressurizing with nitrogen gas after completed refrigerant piping work If the dunsity of refrigerant exceeds the limit in the event of refrigerant leakage in the small roon, lack of oxyg occur, which can cause serious accidents.

• For drain pipe installation, be sure to make descending slope of greater than 1/100, not to make traps and not to make air-bleeding.

 Ensure the insulation on the pipes for refrigeration circuit so as not to condense water. ncompete insulation could cause condensation and it would wet ceiling, floor, and any other valuable:

Do not install the outdoor unit where is likely to be a nest for insects and small animals

nic components and cause breakdown and fire. Instruct the user nals could come into the electro

Pay extra attention, carrying the unit by hand.

0 rry the unit with 2 people if it is heavier than 20kg. Do not use the plastic straps but the grabbing place, moving the hanc. Use protective gloves in order to avoid injury by the aluminum fin.

 Make sure to dispose of the packaging material. Leaving the materials may cause injury as metals like nail and woods are used in the package

 Do not operate the system without the air filter. use the breakdown of the system due to clogging of the heat exchanger

Do not touch any button with wet hands.

 Do not touch the refrigerant piping with bare hands when in operation The pipe during operation would be very hot or cold according to the operating condition, and it could cause a bu

 Do not clean up the air conditioner with water It could cause electric shock.

Do not turn off the power source immediately after stopping the operation

Be sure to wait for more than 5 minutes. Otherwise it could cause water leakage or brea

Do not control the operation with the circuit breaker.
It could cause fire or water leakage. In addition, the fan may start operation unexpectedly and it may cause injury.

#### ① Before installation

- Install correctly according to the installation manual.
- Confirm the following points:
- O Unit type/Power supply specification O Pipes/Wires/Small parts O Accessory items

|   | Accessor             | Accessory itme              |                        |                       |         |                        |                        |                           |                         |
|---|----------------------|-----------------------------|------------------------|-----------------------|---------|------------------------|------------------------|---------------------------|-------------------------|
| ı | For unit hanging     |                             |                        | For refrigerant pipe  |         |                        | For dra                | om pipe                   |                         |

#### 2 Selection of installation location for the indoor unit

- ① Select the suitable areas to install the unit under approval of the user.
- Areas where the indoor unit can deliver hot and cold wind sufficiently. Suggest to the user to use a circulator if the ceiling height is over 3m to avoid warm air being accumulated on the ceiling. Areas where there is enough space to install and service.
- Areas where it can be drained properly. Areas where drain pipe descending slope can be taken.
- Areas where there is no obstruction of airflow on both air return grille and air supply port. Areas where fire alarm will not be accidentally activated by the air conditioner.
- Areas where the supply air does not short-circuit.
- Areas where it is not influenced by draft air. Areas not exposed to direct sunlight.
- Areas where dew point is lower than around 28°C and relative humidity is lower than 80%
- This indoor unit is tested under the condition of JIS (Japan Industrial Standard) high humidity condition and confirmed there is no problem. However, there is some risk of condensation drop if the air conditioner is operated under the severer condition than mentioned above.
- If there is a possibility to use it under such a condition, attach additional insulation of 10 to 20mm thick for entire surface of indoor unit, refrigeration pipe and drain pipe.

  Areas where TV and radio stays away more than 1m. (It could cause jamming and noise.)
- Areas where any items which will be damaged by getting wet are not placed such as food, table wares, server, or medical equipment under the unit.
- Areas where there is no influence by the heat which cookware generates.
- Areas where not exposed to oil mist, powder and/or steam directly such as above fryer. Areas where lighting device such as fluorescent light or incandescent light doesn't affect the operation.
- (A beam from lighting device sometimes affects the infrared receiver for the wireless remote controller and the air conditioner might not work property.)

  © Check if the place where the air conditioner is installed can hold the weight of the unit. If it is not
- able to hold, reinforce the structure with boards and beams strong enough to hold it. If the strength is not enough, it could cause injury due to unit falling.

  ③ If there are 2 units of wireless type, keep them away for more than 5m to avoid malfunction due to
- cross communication.
- When plural indoor units are installed nearby, keep them away for more than 4m.

#### Space for installation and service

- When it is not possible to keep enough space between indoor unit and wall or between indoor units, close the air supply port where it is not possible to keep space and confirm there is no short circuit
- Install the indoor unit at a height of more than 2.5m above the floor.

#### 3 Preparation before installation

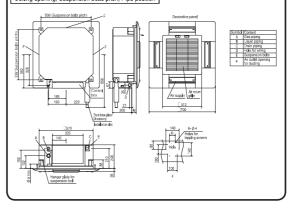

- suspension bolt becomes longer, do reinforcement of earthquake resistant.
- O For grid ceiling When suspension bolt length is over 500mm, or the gap between the ceiling and roof is over
- The subject score to the region to the region to the subject to the bott.

  O In case the unit is hanged directly from the slab and is installed on the ceiling plane which has enough strength.

  When suspension bolt length is over 1000mm, apply the earthquake resistant brace to the bolt.

  Prepare four (4) sets of suspension bolt, nut and spring washer (M10 or M8) on site.

#### Ceiling opening, Suspension bolts pitch, Pipe position

#### 4 Installation of indoor unit

#### Work procedure

 This units is designed for 2 x 2 grid ceiling.
 If necessary, please detach the T bar temporarily before you install it.
 If it is installed on a ceiling other than 2 x 2 grid ceiling, provide an inspection port on the control box side.

- Arrange the suspension bolt at the right position (530mmx530mm).

  Make sure to use four suspension bolts and fix them so as to be able to hold 500N load.
- Ensure that the lower end of the suspension bolt should be 45mm above the ceiling plane Temporarily put the four lower nuts 88mm above the ceiling plane and the upper nuts on distant place from the lower nuts in order not to obstruct hanging the indoor unit or adjust the indoor unit position, and then hang the indoor unit.

Adjust the indoor unit position after hanging it by inserting the level gauge attached on the package into the air supply port and checking if the gap between the ceiling plane and the indoor unit is appropriate. In order to adjust the indoor unit position, adjust the lower nuts while the upper nuts are put on distant place. Confirm there is no backlash between the hanger plate for suspension bolt and the lower nut and washer.

#### 4 Installation of indoor unit (continued)

6. Make sure to install the indoor unit horizontally. Confirm the levelness of the indoor unit with a level gauge or transparent hose filled with water. Keep the height difference at both ends of the indoor unit within 3mm.

Tighten four upper nuts and fix the unit after height and levelness

#### Caution

- Do not adjust the height by adjusting upper nuts. It will cause unexpected stress on the indoor unit
  and it will lead to deformation of the unit, failure of attaching a panel, and generating noise from the
- Make sure to install the indoor unit horizontally and set the gap between the unit underside and the ceiling plane properly. Improper installation may cause air leakage, dew condensation, water

- the celling plane properly. Improper installation may cause air leakage, dew condensation, water leakage and noise.

  Even after decorative panel attached, still the unit height can be adjusted finely. Refer to the installation manual for decorative panel for details.

  Make sure there is no gap between decoration panel and ceiling surface, and between decoration panel and the indoor unit. The gap may cause air leakage, dew condensation and water leakage. In case decorative panel is not installed at the same time, or ceiling material is installed after the unit installed, put the cardboard template for installation attached on the package (packing material of cardboard box) on the bottom of the unit in order to avoid dust coming into the indoor unit.

#### ⑤ Refrigerant pipe

#### Caution

- Use the new refrigerant pipe.
- When re-using the existing pipe system for R22 or R407C, pay attention to the following items.

  Change the flare nuts with the attached ones (JIS category 2), and reprocess the flare parts. Do not use thin-walled pipes.
- Use phosphorus deoxidized copper alloy seamless pipe (C1220T specified in JIS H3300) for
- Use pnospnorus deoxorized copper alloy seamless pipe (C12201 specified in JIS H3300) for refrigeration pipe installation. In addition, make sure there is no damage both inside and outside of the pipe, and no harmful substances such as sulfur, oxide, dust or a contaminant stuck on the pipes.

  Do not use any refrigerant other than R410A.

  Using other refrigerant except R410A (R22 etc.) may degrade inside refrigeration oil. And air getting into refrigeration circuit may cause over-pressure and resultant it may result in bursting, etc.

  Store the copper pipes indoors and seal the both end of them until they are brazed in order to avoid any dust differ ywater petition to his O. Merwise it will except depression oil and
- any dust, dirt or water getting into pipe. Otherwise it will cause degradation of refrigeration oil and compressor breakdown, etc.
- Use special tools for R410 refrigerant

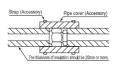

#### Work procedure

- N. Remove the flare nut and blind flanges on the pipe of the indoor unit.
   Make sure to loosen the flare nut with holding the nut on pipe side with a spanner and giving torque to the nut with another spanner in order to avoid unexpected stress to the copper pipe and then remove them.
   (Gas may come out at this time, but it is not abnormal.)
  - Pay attention whether the flare nut pops out. (as the indoor unit is sometimes pressured.)
- Pay attention whenever the nare nut pops out, as the indoor unit is sometimes pressured.)
   Make a flare on fliquid pipe and gas pipe, and connect the refrigeration pipes on the indoor unit.
   Bend the pipe with as big radius as possible and do not bend the pipe repeatedly. In addition, do not twist and crush the pipes.
   Do a flare connection as follows:
   Make sure to loosen the flare nut with holding the nut on pipe side with a spanner and giving torque to the nut with another spanner in order to avoid unexpected stress to the copper pipe, and there convoke them.
- and then remove them.
- When fastening the flare nut, align the refrigeration pipe with the center of flare nut, screw the when hastening the later but, align the retrigeration pipe with the center of nater ont, screw the
  nut for 3-4 times by hand and then tighten it by spanner with the specified torque mentioned
  in the table below. Make sure to hold the pipe on the indoor unit securely by a spanner when
  tightening the nut in order to avoid unexpected stress on the copper pipe.
   Cover the flare connection part of the indoor unit with attached insulation material after a gas
  leakage inspection, and tighten both ends with attached straps.
   Make sure to insulate both gas pipes and liquid pipes completely.
   Mache sure to insulate both gas pipes and liquid pipes completely.
   Mean part of the properties of the properties.

- X Incomplete insulation may cause dew condensation or water dropping
- Refrigerant is charged in the outdoor unit.

  As for the additional refrigerant charge for the indoor unit and piping, refer to the installation manual attached to the outdoor unit.

| Pipe diameter | Tightening torque N·m |
|---------------|-----------------------|
| φ 6.35        | 14 to 18              |
| ф 9.52        | 34 to 42              |
| ф 12.7        | 49 to 61              |
| φ 15.88       | 68 to 82              |
| 1. 10 OF      | 100 to 100            |

### 6 Drain pipe

#### Caution

- Install the drain pipe according to the installation manual in order to drain properly
- Instantine train tipe according to the instantation maintain motive to train property.

  Imperfection in draining may cause flood indoors and wetting the household goodsetc.

  Do not put the drain pipe directly into the ditch where toxic gas such as sulfur, the other harmful and inflammable gas is generated. Toxic gas would flow into the room and it would cause serious damage to user's health and safety (some poisoning or deficiency of oxygen). In addition, it may
- cause corrosion of heat exchanger and bad smell.

  Connect the pipe securely to avoid water leakage from the joint.

  Insulate the pipe properly to avoid condensation drop.
- Check if the water can flow out properly from both the drain outlet on the indoor unit and the end of
- the drain pipe after installation.

  Make sure to make descending slope of greater than 1/100 and do not make up-down bend and/or trap in the midway. In addition, do not put air vent on the drain pipe. Check if water is drained out properly from the pipe during commissioning. Also, keep sufficient space for inspection and maintenance

#### ⑥ Drain pipe (continued)

#### Work procedure

- 1. Make sure to insert the drain hose (the end mode of soft PVC) to the end of the step part of drain
  - Attach the hose clamp to the drain hose around 10mm from the end, and fasten the screw within 5mm left to the nut
  - Do not apply adhesives on this end.

- Prepare a joint for connecting VP-20 pine, adhere and connect the joint to the drain hose (the end made of rigid PVC), and adhere and connect VP-20 pipe (prepare on site).

  As for drain pipe, apply VP-20 made of rigid PVC which is on the market.
- Make sure that the adhesive will not get into the supplied drain hose.
- It may cause the flexible part broken after the adhesive is dried up and gets rigid.

  Do not bend or make an excess offset on the drain hose as shown in the picture. Bend or excess offset will cause drain leakage.

- Make sure to make descending slope of greater than 1/100 and do not make up-down bend and/or trap in the midway.
- Pay attention not to give stress on the pipe on the indoor unit side, and support and fix the pipe as close place to the unit as possible when connecting the drain pipe.
- Do not set up air vent.

 When sharing a drain pipe for more than one unit, lay the main pipe 100mm below the drain outlet of the unit. In addition, select VP-30 or

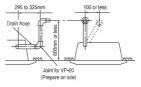

- Insulate the drain pipe
- Be sure to insulate the drain socket and rigid PVC pipe installed indoors otherwise it may cause dew condensation and water leakage.

  X After drainage test implementation, cover the drain socket part with pipe cover (small size),
  - then use the pipe cover (big size) to cover the pipe cover (small size), clamps and part of the drain hose, and fix and wrap it with tapes to wrap and make joint part gapless.

#### Drain up

The position for drain pipe outlet can be raised up to 600mm above the ceiling. Use elbows for installation to avoid obstacles inside ceiling. If the horizontal drain pipe is too long before vertical pipe, the backflow of water will increase when the unit is stopped, and it may cause overflow of water from the drain pan on the indoor unit. In order to avoid overflow, keep the horizontal pipe length and offset of the pipe within the limit shown in the figure below.

## **6** Drain pipe (continued)

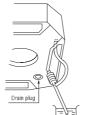

#### Drain test

- After installation of drain pipe, make sure that drain system work in good condition and no water leakage from joint and drain pan. Check if the motor sound of drain pump is normal or not.

  Do drain test even if installation of heating season.
- For new building cases, make sure to complete the test before
- hanging the ceiling.

  1. Pour water of about 1000cc into the drain pan in the indoor unit by pump so as not to get the electrical component wet.
- Make sure that water is drained out properly and there is no water leakage from any joints of the drain pipe at the test. Confirm that the water is properly drained out while the drain motor is operating. At the drain socket (transparent), it is possible to check if the water is drained out properly.

  3. Unplug the drain plug on the indoor unit to remove remaining water
- on the drain pan after the test, and re-plug it. And insulate the drain pipe properly finally.

#### Drain pump operation

#### O In case electrical wiring work finished

Drain pump can be operated by remote controller (wired).

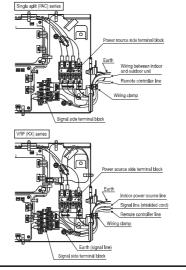

For the operation method, refer to Operation for drain pump in the installation manual for wiring work.

O In case electrical wiring work not finished

Drain pump will run continuously when the dip switch "SW7-1" on the indoor unit PCB is turned ON, the Connector CNB is disconnected, and then the power supply (220-240VAC on the terminal block  $[\,\,\bar{}\,\,]$  and  $(\bar{}\,\,)$  ] ) is turned ON. Make sure to turn OFF "SW7-1" and reconnect the Connector CNB after the test.

#### Wiring-out position and wiring connection

- Electrical installation work must be performed according to the installation manual by an electrical installation service provider qualified by a power provider of the country, and be executed according to the technical standards and other regulations applicable to electrical installation in the country. Be sure to use an exclusive circuit.
- Use specified cord, fasten the wiring to the terminal securely, and hold the cord securely in order
- oto apply unexpected stress on the terminal.
   Do not put both power source line and signal line on the same route. It may cause miscommunication and malfunction.
- Be sure to do D type earth work.
   For the details of electrical wiring work, see attached instruction manual for electrical wiring work.
- Remove a lid of the control box (1 screws).
   Hold each wiring inside the unit and fasten them to terminal block securely.
   Fix the wiring with clamp.
   Install all do the control box back to original place.

#### ® Panel installation

After wiring work finished, install the panel on the indoor unit.
 Refer to attached panel installation manual for details.

#### Accessory items

| 1 | Hook  | 749       | 1 piece  | For fixing temporarily   |
|---|-------|-----------|----------|--------------------------|
| 2 | Chain | NOONOON N | 2 pieces |                          |
| 3 | Bolt  | (Tames    | 4 pieces | For installing the panel |
| 4 | Screw | €#        | 1 piece  | For attaching a hook     |
| 5 | Screw | 6pm       | 2 pieces | For attaching a chain    |

- Attach the panel on the indoor unit after electrical wiring work.
   Refer to attached manual for panel installation for details. (See next page)

#### Oheck list after installation

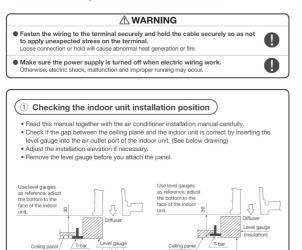

Check the following items after all installation work completed.

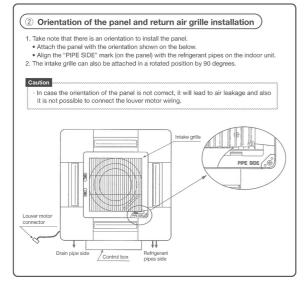

| Check if   | Expected trouble                  | Check |
|--|-----------------------------------|-------|
| The indoor and outdoor units are fixed securely?             | Falling, vibration, noise         |       |
| Inspection for leakage is done?                              | Insufficient capacity             |       |
| Insulation work is properly done?                            | Water leakage                     |       |

# PANEL INSTALLATION MANUAL

Please read this manual together with the indoor unit's installation manual.

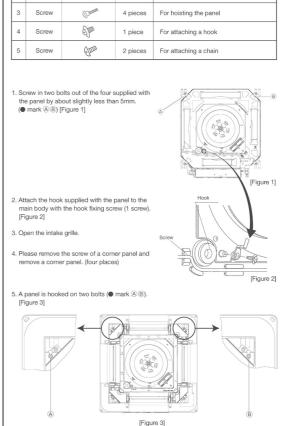

#### Install the panel on the unit after completing the electrical wiring. Accessories Hook 70 1 piece For fixing temporarily 2 Chain 2 pieces 3 Screw Dage 4 pieces For hoisting the panel O min Screw For attaching a hook 5 Screw (Jun For attaching a chain

(5) Panel installation

2•4•6•8 3•5•7•9

In case the louver No to be set is uncertain, set any louver temporarily. The louver will swing once when the setting is completed and it is possible to confirm the louver No and the position. After that, choose the correct louver No and set the top and bottom position.

No.2 No.3 No.3

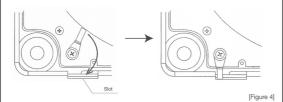

No.4

the position of the louver

NOTICE

10

6. Please rotate a hook, put in the slot on the panel, and carry out fixing the panel temporarily. [Figure 4]

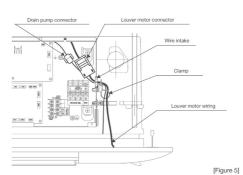

7. Tighten the two bolts used for fixing the panel temporarily and the other two.

# Improperly tightened hanging bolts can cause the problems listed below, so make sure that you have tightened them securely. ceiling and the decorative panel even after the hanging bolts are tightened, adjust the installation level of the indoor unit again. Fouling / Make sure no gap is left here.

- 8. Please open the lid of a control box
- 9. Like drain pump wiring, please band together by the clamp and put in louver motor wiring into a control box. [Figure 5]

  10. Please connect a louver motor connector. [Figure 5]

11. Attach two chains to the intake grille with two screws. [Figure 6]

12. Replace the corner panels. Please also close a chain with a screw together then. [Figure 7]

13. Close the intake grill.

Caution

Make sure there is no stress given on the panel when adjusting the height of the indoor unit to avoid unexpected distortion. It may cause the distortion of panel or failing to close the air return grille.

#### $( ilde{ extstyle 7 } )$ How to set the airflow direction )

It is possible to change the mousbe range of the lower on the air outlet from the wired remote controller. Once the top and bottom position is set, the lower will swing within the range between the top and the bottom when swing operation is chosen. It is also possible to apply different setting to each follower.

Note: This function is not able to be set with wireless remote controller or simple remote controll(RCH - H3).

1 Stop the air conditioner and press SET button and LOVER SED button similar lancously for three seconds or more.

The following is displayed if the number of the indoor units connected to the remote controller is one. Go to step 4.

"6-\$ SELECT I/U "

2 Press ▲ or ▼ button. (selection of indoor unit)
Select the indoor unit of which the louver is set.

Select the indoor unit of which the louver is set.

\*57No.1 A"

4 Press ▲ or ▼ button. (selection of louver No.) Select the louver No. to be set according to the right figure. Select the louver No. to be set according to the right fig [EXAMPLE] "중구 No.1 호" " 중구 No.2 호" " 중구 No.3 호" \*\* "중구 No.4 ▼"

Press SET button. (Determination of louver No.)
The buser No. to be set is confirmed and the display shows th upper limit of the movable range.

[EXAMPLE] If No. louver is selected

"No. | □FFED ↑" ← current upper limit position

6 Press ▲ or ▼ button, (selection of upper limit position)

ress ▲ or ▼ button. (selection of upper limit position)

Select the upper limit of lower movable range.

"position "1's is the most horizontal, and "position 6" is the most downward.

"position "1's to return to the factory setting. If you need to change the setting to the default setting, use "position —".

"%s. IFFRS! "" the most horizontal)

"%s. IFFRS! "" the most horizontal)

"%s. IFFRS! "

"%s. IFFRS = " the most downwards)

"%s. IFFRS = " return to the default setting.

7 Press SET button. (i in of the upper limit position)
The upper limit position is fixed and the setting position is displayed for two seconds. Then proceed to lower limit position selection display.

[EXAMPLE]
No. 1 UPPER2 (displayed for two seconds)

No.1 UPPER2 (displayed for two secon No.1 LONER5 \$ (shows current setting) 8 Press ▲ or ▼ button. (Selection of lower limit position)

ress ▲ or ▼ button. (Selection of lower limit position)

Select the lower limit position of lower limit position of lower.

"position 1" is the most horizontal, and "position 6" is the most downwards.

"position 1" is to result to the factory setting. If you need to change the setting to the default setting, use "position --".

In [...] [...] ("I will be most horizontal)

In [...] [...] [...] ("I will be most horizontal)

In [...] [...] ("I will be most horizontal)

In [...] [...] ("I will be most downwards)

In [...] [...] ("I will be "I will

9 Press 0. SET button. (i in of the lower limit position)
Upper limit position and lower limit position are fixed, and the set positions are displayed for two seconds, then setting is completed.

• After the setting is completed, the louver which was set moves from the original position to the lower limit position, and goes back to the original position again. (This operation is not performed if the indoor unit and or indoor unit fair is in operation).

[EXAMPLE]
Is 10 (displayed for two seconds)

SET COMPLETE

ক\_No.1 ▲

Press Concere button.
 Louver adjusting mode ends and returns to the original display.
 For setting the swing range of other louvers, return to 1 and proceed same procedure respectively.

# ATTENTION

[Figure 6]

[Figure 7]

If the upper limit position number and the lower limit position number are set to the same position, the louver is fixed at that position auto swing does not function.

If you press RESET button during settings, the display will return to previous display. If you press ONOFF button during settings, the mode will be ended and return to original display, and the settings that have not been completed will become invalid. When plural remote controllers are connected, louver setting operation cannot be set by slave remote controller.

controller.

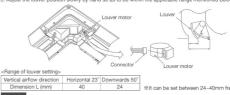

If it is necessary to fix the louver position manually, follow the procedure mentioned below.

1. Shut off the main power switch.

2. Unplug the connector of the louver motor which you want to fix the position.

Make sure to insulate unplugged connectors electrically with a viryl tape.

3. Adjust the louver position slowly by hard os as to be within the applicable range mentioned below table.

# Orderson Lymin - Any automatic control or operation from the remote controller will be disabled on the louver whose position is fixed in the above way. - Do not set a louver beyond the specified range, Failure to observe this instruction may result in dripping, dew condensation, the fouling of the ceiling and the malfunctioning of the unit.
